# 3GPP TS 38.212 v16.4.0 (2020-12) 

$3 G P$

AGLOBALINITIATIVE

The present document has been developed within the 3rd Generation Partnership Project (3GPP ${ }^{\mathrm{TM}}$ ) and may be further elaborated for the purposes of 3GPP.. The present document has not been subject to any approval process by the 3GPP Organizational Partners and shall not be implemented.
This Specification is provided for future development work within 3GPP only. The Organizational Partners accept no liability for any use of this Specification.
Specifications and Reports for implementation of the 3GPP ${ }^{\text {TM }}$ system should be obtained via the 3GPP Organizational Partners' Publications Offices.

## Foreword

This Technical Specification has been produced by the 3rd Generation Partnership Project (3GPP).
The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z
where:
x the first digit:
1 presented to TSG for information;
2 presented to TSG for approval;
3 or greater indicates TSG approved document under change control.
y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
z
the third digit is incremented when editorial only changes have been incorporated in the document.

## 1 Scope

The present document specifies the coding, multiplexing and mapping to physical channels for 5G NR.

## 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document in the same Release as the present document.

## 3 Definitions, symbols and abbreviations

### 3.1 Definitions

For the purposes of the present document, the terms and definitions given in TR 21.905 [1] and the following apply. A term defined in the present document takes precedence over the definition of the same term, if any, in TR 21.905 [1].

### 3.2 Symbols

For the purposes of the present document, the following symbols apply:

### 3.3 Abbreviations

For the purposes of the present document, the abbreviations given in TR 21.905 [1] and the following apply. An abbreviation defined in the present document takes precedence over the definition of the same abbreviation, if any, in TR 21.905 [1].

| BCH | Broadcast channel |
| :---: | :---: |
| CBG | Code block group |
| CBGTI | Code block group transmission information |
| CG | Configured grant |
| CG-DFI | CG downlink feedback information |
| CG-UCI | CG uplink control information |
| CORESET | Control resource set |
| COT | Channel occupancy time |
| CQI | Channel quality indicator |
| CRC | Cyclic redundancy check |
| CRI | CSI-RS resource indicator |
| CSI | Channel state information |
| CSI-RS | CSI reference signal |
| DAI | Downlink assignment index |
| DCI | Downlink control information |
| DL | Downlink |
| DL-SCH | Downlink shared channel |
| DMRS | Dedicated demodulation reference signal |
| HARQ | Hybrid automatic repeat request |
| HARQ-ACK | Hybrid automatic repeat request acknowledgement |
| LDPC | Low density parity check |
| LI | Layer indicator |
| MCS | Modulation and coding scheme |
| OFDM | Orthogonal frequency division multiplex |
| PBCH | Physical broadcast channel |
| PCH | Paging channel |
| PDCCH | Physical downlink control channel |
| PDSCH | Physical downlink shared channel |
| PMI | Precoding matrix indicator |
| PRB | Physical resource block |
| PRACH | Physical random access channel |
| PSBCH | Physical sidelink broadcast channel |
| PSCCH | Physical sidelink control channel |
| PSFCH | Physical sidelink feedback channel |
| PSSCH | Physical sidelink shared channel |
| PTRS | Phase-tracking reference signal |
| PUCCH | Physical uplink control channel |
| PUSCH | Physical uplink shared channel |
| RACH | Random access channel |
| RI | Rank indicator |
| RSRP | Reference signal received power |
| SCI | Sidelink control information |
| SFCI | Sidelink feedback control information |
| SFN | System frame number |
| SL | Sidelink |
| SL-BCH | Sidelink broadcast channel |
| SL-SCH | Sidelink shared channel |
| SR | Scheduling request |
| SRS | Sounding reference signal |
| SS | Synchronisation signal |
| SUL | Supplementary uplink |
| TPC | Transmit power control |
| TrCH | Transport channel |
| UCI | Uplink control information |
| UE | User equipment |

UL Uplink
UL-SCH Uplink shared channel
VRB Virtual resource block
ZP CSI-RS
Zero power CSI-RS

## 4 Mapping to physical channels

### 4.1 Uplink

Table 4.1-1 specifies the mapping of the uplink transport channels to their corresponding physical channels. Table 4.1-2 specifies the mapping of the uplink control channel information to its corresponding physical channel.

Table 4.1-1

| TrCH | Physical Channel |
| :--- | :--- |
| UL-SCH | PUSCH |
| RACH | PRACH |

Table 4.1-2

| Control information | Physical Channel |
| :--- | :--- |
| UCI | PUCCH, PUSCH |

### 4.2 Downlink

Table 4.2-1 specifies the mapping of the downlink transport channels to their corresponding physical channels. Table 4.2-2 specifies the mapping of the downlink control channel information to its corresponding physical channel.

Table 4.2-1

| TrCH | Physical Channel |
| :--- | :--- |
| DL-SCH | PDSCH |
| BCH | PBCH |
| PCH | PDSCH |

Table 4.2-2

| Control information | Physical Channel |
| :--- | :--- |
| DCl | PDCCH |

### 4.3 Sidelink

Table 4.3-1 specifies the mapping of the sidelink transport channels to their corresponding physical channels. Table 4.32 specifies the mapping of the sidelink control information and sidelink feedback control information to their corresponding physical channels.

Table 4.3-1

| TrCH | Physical Channel |
| :--- | :--- |
| SL-SCH | PSSCH |
| SL-BCH | PSBCH |

Table 4.3-2

| Control information | Physical Channel |
| :--- | :--- |
| $1^{\text {st }}$-stage SCl | PSCCH |
| $2^{\text {nd }}$-stage SCl | PSSCH |
| SFCl | PSFCH |

## 5 General procedures

Data and control streams from/to MAC layer are encoded /decoded to offer transport and control services over the radio transmission link. Channel coding scheme is a combination of error detection, error correcting, rate matching, interleaving and transport channel or control information mapping onto/splitting from physical channels.

### 5.1 CRC calculation

Denote the input bits to the CRC computation by $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$, and the parity bits by
$p_{0}, p_{1}, p_{2}, p_{3}, \ldots, p_{L-1}$, where $A$ is the size of the input sequence and $L$ is the number of parity bits. The parity bits are generated by one of the following cyclic generator polynomials:

$$
\begin{array}{ll}
- & g_{\mathrm{CRC} 24 \mathrm{~A}}(D)=\left[D^{24}+D^{23}+D^{18}+D^{17}+D^{14}+D^{11}+D^{10}+D^{7}+D^{6}+D^{5}+D^{4}+D^{3}+D+1\right] \quad \text { for a CRC length } \\
L=24 ; \\
- & g_{\mathrm{CRC} 24 \mathrm{~B}}(D)=\left[D^{24}+D^{23}+D^{6}+D^{5}+D+1\right] \text { for a CRC length } L=24 ; \\
- & g_{\mathrm{CRC} 24 \mathrm{C}}(D)=\left[D^{24}+D^{23}+D^{21}+D^{20}+D^{17}+D^{15}+D^{13}+D^{12}+D^{8}+D^{4}+D^{2}+D+1\right] \text { for a CRC length } \\
L=24 ; \\
- & g_{\mathrm{CRC} 16}(D)=\left[D^{16}+D^{12}+D^{5}+1\right] \quad \text { for a CRC length } L=16 ; \\
- & g_{\mathrm{CRC} 11}(D)=\left[D^{11}+D^{10}+D^{9}+D^{5}+1\right] \text { for a CRC length } L=11 ; \\
- & g_{\mathrm{CRC} 6}(D)=\left[D^{6}+D^{5}+1\right] \quad \text { for a CRC length } L=6 .
\end{array}
$$

The encoding is performed in a systematic form, which means that in GF(2), the polynomial:

$$
a_{0} D^{A+L-1}+a_{1} D^{A+L-2}+\ldots+a_{A-1} D^{L}+p_{0} D^{L-1}+p_{1} D^{L-2}+\ldots+p_{L-2} D^{1}+p_{L-1}
$$

yields a remainder equal to 0 when divided by the corresponding CRC generator polynomial ${ }^{\text { }}$
The bits after CRC attachment are denoted by $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$, where $B=A+L$. The relation between $a_{k}$ and $b_{k}$ is:

$$
\begin{array}{ll}
b_{k}=a_{k} \quad \text { for } \quad k=0,1,2, \ldots, A-1 \\
b_{k}=p_{k-A} \quad \text { for } \quad k=A, A+1, A+2, \ldots, A+L-1 .
\end{array}
$$

### 5.2 Code block segmentation and code block CRC attachment

### 5.2.1 Polar coding

The input bit sequence to the code block segmentation is denoted by $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$, where $A>0$.
if $\quad I_{s e g}=1$

```
    Number of code blocks: C=2 ;
else
    Number of code blocks: C=1
end if
```

$$
\begin{aligned}
& A^{\prime}=[A / C] \cdot C ; \\
& \text { for } \quad i=0 \quad \text { to } \quad A^{\prime}-A-1 \\
& a_{i}^{\prime}=0
\end{aligned}
$$

end for

$$
\begin{aligned}
& \text { for } \quad i=A^{\prime}-A \text { to } A^{\prime}-1 \\
& a_{i}^{\prime}=a_{i-\left|A^{\prime}-A\right|} ;
\end{aligned}
$$

end for

$$
s=0 \text {; }
$$

$$
\begin{aligned}
& \text { for } \begin{aligned}
& r=0 \text { to } C-1 \\
& \text { for } k=0 \text { to } A^{\prime} / C-1 \\
& c_{r k}=a_{s}^{\prime} ; \\
& s=s+1
\end{aligned}
\end{aligned}
$$

end for
The sequence $C_{r 0}, C_{r 1}, C_{r 2}, C_{r 3}, \ldots, C_{\left.r \mid A^{\prime} / C-1\right)}$ is used to calculate the CRC parity bits $p_{r 0}, p_{r 1}, p_{r 2}, \ldots, p_{r(L-1)}$ according to Clause 5.1 with a generator polynomial of length $L$.
for $k=A^{\prime} / C$ to $A^{\prime} / C+L-1$

$$
c_{r k}=p_{r\left|k-A^{\prime} / C\right|}
$$

end for
end for
The value of $A$ is no larger than 1706.

### 5.2.2 Low density parity check coding

The input bit sequence to the code block segmentation is denoted by $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$, where $B>0 \quad$. If $\quad B$ is larger than the maximum code block size $K_{c b}$, segmentation of the input bit sequence is performed and an additional CRC sequence of $L=24$ bits is attached to each code block.

For LDPC base graph 1, the maximum code block size is:

- $\quad K_{c b}=8448$

For LDPC base graph 2, the maximum code block size is:

$$
-\quad K_{\mathrm{cb}}=3840
$$

Total number of code blocks $C$ is determined by:
if $B \leq K_{\text {cb }}$

$$
L=0
$$

Number of code blocks: $\quad C=1$

$$
B^{\prime}=B
$$

else

$$
L=24
$$

Number of code blocks: $C=\left\lceil B /\left(K_{c b}-L\right)\right\rceil$.

$$
B^{\prime}=B+C \cdot L
$$

end if
The bits output from code block segmentation are denoted by $c_{r 0}, c_{r 1}, c_{r 2}, c_{r 3}, \ldots, c_{r\left|K_{r}-1\right|}$, where $\quad 0 \leq r<C \quad$ is the code block number, and $K_{r}=K \quad$ is the number of bits for the code block number $r$.

The number of bits $K$ in each code block is calculated as:

$$
K^{\prime}=B^{\prime} / C \text {; }
$$

For LDPC base graph 1,

$$
K_{b}=22
$$

For LDPC base graph 2,
if $B>640$

$$
K_{b}=10 ;
$$

elseif $B>560$

$$
K_{b}=9 \text {; }
$$

elseif $B>192$

$$
K_{b}=8
$$

else

$$
K_{b}=6 \text {; }
$$

end if
find the minimum value of $Z \quad$ in all sets of lifting sizes in Table 5.3.2-1, denoted as $Z_{c}$, such that $K_{b} \cdot Z_{c} \geq K^{\prime}$, and set $K=22 Z_{c} \quad$ for LDPC base graph 1 and $\quad K=10 Z_{c} \quad$ for LDPC base graph 2;

The bit sequence ${ }^{c_{r k}}$ is calculated as:

```
    \(s=0\);
    for \(r=0\) to \(C-1\)
    for \(k=0\) to \(K^{\prime}-L-1\)
        \(c_{r k}=b_{s}\);
        \(s=s+1\);
    end for
    if \(C>1\)
```

        The sequence \({ }^{C_{r 0}}, C_{r 1}, C_{r 2}, C_{r 3}, \ldots, C_{\left.r \mid K^{\prime}-L-1\right)}\) is used to calculate the CRC parity bits \(p_{r 0}, p_{r 1}, p_{r 2}, \ldots, p_{r(L-1)}\)
        according to Clause 5.1 with the generator polynomial \(g_{\text {CRC24B }}(D)\).
        for \(k=K^{\prime}-L\) to \(K^{\prime}-1\)
                \(c_{r k}=p_{r\left(k+L-K^{\prime}\right)} ;\)
        end for
        end if
    for \(k=K^{\prime}\) to \(K-1 \quad--\) Insertion of filler bits
        \(c_{r k}=<\underset{i}{N U L L>i}\).
        end for
    end for
    
### 5.3 Channel coding

Usage of coding scheme for the different types of TrCH is shown in table 5.3-1. Usage of coding scheme for the different control information types is shown in table 5.3-2.

Table 5.3-1: Usage of channel coding scheme for TrCHs

| TrCH | Coding scheme |
| :---: | :---: |
| UL-SCH | LDPC |
| DL-SCH |  |
| PCH | Polar code |
| BCH |  |
| $y$ |  |

Table 5.3-2: Usage of channel coding scheme for control information

| Control Information | Coding scheme |
| :---: | :---: |
| DCl | Polar code |
| UCI | Block code |
|  | Polar code |

### 5.3.1 Polar coding

The bit sequence input for a given code block to channel coding is denoted by $c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{K-1}$, where $K$ is the number of bits to encode. After encoding the bits are denoted by $d_{0}, d_{1}, d_{2}, \ldots, d_{N-1}$, where $N=2^{n}$ and the value of $n$ is determined by the following:

Denote by $E$ the rate matching output sequence length as given in Clause 5.4.1;

$$
\begin{aligned}

$$

UE is not expected to be configured with $K+n_{P C}>E$, where $\quad n_{P C} \quad$ is the number of parity check bits defined in Clause 5.3.1.2.

### 5.3.1.1 Interleaving

The bit sequence $c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{K-1}$ is interleaved into bit sequence $c^{\prime}{ }_{0}, c^{\prime}{ }_{1}, c^{\prime}{ }_{2}, c^{\prime}{ }_{3}, \ldots, c^{\prime}{ }_{K-1}$ as follows:

$$
c_{k}^{\prime}=c_{\Pi|k|}, \quad k=0,1, \ldots, K-1
$$

where the interleaving pattern $\Pi|k|$ is given by the following:

$$
\text { if } \quad I_{I L}=0
$$

$$
\Pi(k)=k \quad, \quad k=0,1, \ldots, K-1
$$

else

$$
k=0 \quad ;
$$

$$
\text { for } m=0 \quad \text { to } \quad K_{I L}^{\max }-1
$$

$$
\text { if } \quad \Pi_{I L}^{\max }(m) \geq K_{I L}^{\max }-K
$$

$$
\Pi(k)=\Pi_{I L}^{\max }(m)-\left(K_{I L}^{\max }-K\right)
$$

$$
k=k+1
$$

end if
end for
end if
where $\quad \Pi_{I L}^{\max }(m) \quad$ is given by Table 5.3.1.1-1 and $\quad K_{I L}^{\max }=164$.

### 5.3.1.2 Polar encoding

The Polar sequence $Q_{0}^{N_{\max }-1}=\left\{Q_{0}^{N_{\text {max }}}, Q_{1}^{N_{\max }}, \ldots, Q_{N_{\max }-1}^{N_{\max }}\right\} \quad$ is given by Table 5.3.1.2-1, where $0 \leq Q_{i}^{N_{\max }} \leq N_{\max }-1$ denotes a bit index before Polar encoding for $i=0,1, \ldots, N_{\max }-1$ and $N_{\max }=1024$. The Polar sequence $Q_{0}^{N_{\max }-1}$ is in ascending order of reliability $\quad W\left(Q_{0}^{N_{\max }}\right)<W\left(Q_{1}^{N_{\max }}\right) \quad b_{1}<W\left(Q_{N_{\max }-1}^{N_{\max }}\right)$, where $W\left(Q_{i}^{N_{\max }}\right)$ denotes the reliability of bit index $Q_{i}^{N_{\text {max }}}$.

For any code block encoded to $\quad N \quad$ bits, a same Polar sequence $\quad Q_{0}^{N-1}=\left(Q_{0}^{N}, Q_{1}^{N}, Q_{2}^{N}, \ldots, Q_{N-1}^{N}\right) \quad$ is used. The Polar sequence $Q_{0}^{N-1}$ is a subset of Polar sequence $Q_{0}^{N_{\max }-1}$ with all elements $Q_{i}^{N_{\max }}$ of values less than $N$, ordered in ascending order of reliability $W\left(Q_{0}^{N}\right)<W\left(Q_{1}^{N}\right)<W\left(Q_{2}^{N}\right)<\ldots<W\left(Q_{N-1}^{N}\right)$.

Denote $\bar{Q}_{I}^{N} \quad$ as a set of bit indices in Polar sequence $\quad Q_{0}^{N-1}$, and $\bar{Q}_{F}^{N} \quad$ as the set of other bit indices in Polar sequence $Q_{0}^{N-1}$, where $\bar{Q}_{I}^{N}$ and $\bar{Q}_{F}^{N}$ are given in Clause 5.4.1.1, $\left|\bar{Q}_{I}^{N}\right|=K+n_{P C}, \quad\left|\bar{Q}_{F}^{N}\right|=N-\left|\bar{Q}_{I}^{N}\right|$, and $n_{P C}$ is the number of parity check bits.
Denote $G_{N}=\left(G_{2}\right)^{\otimes n}$ as the $n$-th Kronecker power of matrix $\quad G_{2}$, where $G_{2}=\left[\begin{array}{ll}1 & 0 \\ 1 & 1\end{array}\right]$.
For a bit index $j$ with $j=0,1, \ldots, N-1$, denote $g_{j}$ as the $j$-th row of $G_{N}$ and $w\left(g_{j}\right)$ as the row weight of $g_{j}$, where $w\left(g_{j}\right)$ is the number of ones in $g_{j}$. Denote the set of bit indices for parity check bits as $Q_{P C}^{N}$, where $\left|Q_{P C}^{N}\right|=n_{P C}$. A number of $\left(n_{P C}-n_{P C}^{w m}\right)$ parity check bits are placed in the $\left(n_{P C}-n_{P C}^{w m}\right)$ least reliable bit indices in $\bar{Q}_{I}^{N}$.A number of $n_{P C}^{w m}$ other parity check bits are placed in the bit indices of minimum row weight in $\widetilde{Q}_{I}^{N}$, where $\widetilde{Q}_{I}^{N}$ denotes the $\left.\quad\left|\bar{Q}_{I}^{N}\right|-n_{P C}\right)$ most reliable bit indices in $\bar{Q}_{I}^{N}$; if there are more than $n_{P C}^{w m} \quad$ bit indices of the same minimum row weight in $\widetilde{Q}_{I}^{N}$, the $n_{P C}^{w m} \quad$ other parity check bits are placed in the $n_{P C}^{w m}$ bit indices of the highest reliability and the minimum row weight in $\widetilde{Q}_{I}^{N}$.

Generate $u=\left[u_{0} u_{1} u_{2} \ldots u_{N-1}\right] \quad$ according to the following:

$$
k=0 \text {; }
$$

$$
\text { if } \quad n_{P C}>0
$$

$$
y_{0}=0 \quad ; \quad y_{1}=0 ; y_{2}=0 ; y_{3}=0 ; y_{4}=0 \text {; }
$$

$$
\text { for } n=0 \quad \text { to } N-1
$$

$$
y_{t}=y_{0} ; y_{0}=y_{1} ; y_{1}=y_{2} ; y_{2}=y_{3} ; y_{3}=y_{4} ; y_{4}=y_{t}
$$

$$
\text { if } n \in \bar{Q}_{I}^{N}
$$

$$
\text { if } \quad n \in Q_{P C}^{N}
$$

$$
u_{n}=y_{0}
$$

else

$$
\begin{aligned}
& u_{n}=c_{k}^{\prime} ; \\
& k=k+1 ; \\
& y_{0}=y_{0} \oplus u_{n} ;
\end{aligned}
$$

end if
else

$$
u_{n}=0 ;
$$

end if
end for
else

$$
\begin{aligned}
& \text { for } \begin{array}{l}
n=0 \quad \text { to } \quad N-1 \\
\text { if } \quad n \in \bar{Q}_{I}^{N} \\
u_{n}=c_{k}^{\prime} ; \\
k=k+1 ; \\
\text { else } \\
\quad u_{n}=0 ;
\end{array}
\end{aligned}
$$

end if
end for
end if
The output after encoding $d=\left[d_{0} d_{1} d_{2} \ldots d_{N-1}\right]$ is obtained by $d=\mathbf{u G}{ }_{N}$. The encoding is performed in GF(2).

### 5.3.2 Low density parity check coding

The bit sequence input for a given code block to channel coding is denoted by $c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{K-1}$, where $K$ is the number of bits to encode as defined in Clause 5.2.2. After encoding the bits are denoted by $d_{0}, d_{1}, d_{2}, \ldots, d_{N-1}$, where $\quad N=66 Z_{c} \quad$ for LDPC base graph 1 and $\quad N=50 Z_{c} \quad$ for LDPC base graph 2, and the value of $Z_{c}$ is given in Clause 5.2.2.

For a code block encoded by LDPC, the following encoding procedure applies:

1) Find the set with index $i_{L S}$ in Table 5.3.2-1 which contains $Z_{c}$.
2) for $k=2 Z_{c}$ to $K-1$
if

$$
c_{k} \neq i \underset{i}{N U L L>i}
$$

$$
d_{k-2 z_{c}}=c_{k} \text {; }
$$

else

$$
\begin{aligned}
& c_{k}=0 ; \\
& d_{k-2 z_{e}=<N U L L>i}^{i} ;
\end{aligned}
$$

end if
end for
3) Generate $N+2 Z_{c}-K$ parity bits $w=\left[w_{0}, w_{1}, w_{2}, \ldots, w_{N+2 Z_{c}-K-1}\right]^{T}$ such that $H \times\left[\begin{array}{l}c \\ w\end{array}\right]=0$, where $c=\left[c_{0}, c_{1}, c_{2}, \ldots, c_{K-1}\right]^{T} ; 0$ is a column vector of all elements equal to 0 . The encoding is performed in GF(2).

For LDPC base graph 1, a matrix of $H_{\text {BG }}$ has 46 rows with row indices $i=0,1,2, \ldots, 45$ and 68 columns with column indices $j=0,1,2, \ldots, 67$. For LDPC base graph 2, a matrix of $H_{B G}$ has 42 rows with row indices $i=0,1,2, \ldots, 41$ and 52 columns with column indices $j=0,1,2, \ldots, 51$. The elements in $H_{B G}$ with row and column indices given in Table 5.3.2-2 (for LDPC base graph 1) and Table 5.3.2-3 (for LDPC base graph 2) are of value 1 , and all other elements in $\quad H_{B G}$ are of value 0 .
The matrix $\quad H$ is obtained by replacing each element of $H_{B G}$ with a $Z_{c} \times Z_{c}$ matrix, according to the following:

- Each element of value 0 in $H_{B G}$ is replaced by an all zero matrix 0 of size $Z_{c} \times Z_{c}$;
- Each element of value 1 in $\quad H_{B G}$ is replaced by a circular permutation matrix $I\left(P_{i, j}\right)$ of size $Z_{c} \times Z_{c}$, where $i \quad$ and $j$ are the row and column indices of the element, and $I\left(P_{i, j}\right) \quad$ is obtained by circularly shifting the identity matrix $I$ of size $Z_{c} \times Z_{c}$ to the right $P_{i, j}$ times. The value of $P_{i, j}$ is given by $P_{i, j}=\bmod \left(V_{i, j}, Z_{c}\right)$. The value of $V_{i, j}$ is given by Tables 5.3.2-2 and 5.3.2-3 according to the set index $i_{L S}$ and LDPC base graph.

4) for $k=K$ to $N+2 Z_{c}-1$

$$
d_{k-2 z_{c}}=w_{k-K} ;
$$

end for

### 5.3.3 Channel coding of small block lengths

The bit sequence input for a given code block to channel coding is denoted by $c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{K-1}$, where $K$ is the number of bits to encode. After encoding the bits are denoted by $d_{0}, d_{1}, d_{2}, \ldots, d_{N-1}$.

### 5.3.3.1 Encoding of 1-bit information

For $K=1$, the code block is encoded according to Table 5.3.3.1-1, where $N=Q_{m}$ and $Q_{m}$ is the modulation order for the code block.

Table 5.3.3.1-1: Encoding of 1-bit information

| $Q_{m}$ | Encoded bits $d_{0}, d_{1}, d_{2}, \ldots, d_{N-1}$ |
| :---: | :---: |
| $\mathbf{1}$ | $\left[c_{0}\right]$ |
| 2 | $\left[c_{0} \mathrm{y}\right]$ |
| 4 | $\left[c_{0} \mathrm{y} \mathrm{x}\right]$ |
| 6 | $\left[c_{0} \mathrm{y} \times \mathrm{xxx}\right]$ |
| 8 | $\left[c_{0} \mathrm{y} \times \times \times \times \times \mathrm{x}\right]$ |

The " x " and " y " in Table 5.3.3.1-1 are placeholders for Clause 6.3.1.1 of [4, TS 38.211] to scramble the information bits in a way that maximizes the Euclidean distance of the modulation symbols carrying the information bits.

### 5.3.3.2 Encoding of 2-bit information

For $K=2$, the code block is encoded according to Table 5.3.3-2, where $c_{2}=\left(c_{0}+c_{1}\right) \bmod 2, N=3 Q_{m}$, and
$Q_{m}$ is the modulation order for the code block.
Table 5.3.3.2-1: Encoding of 2-bit information

| $Q_{m}$ | Encoded bits $d_{0}, d_{1}, d_{2}, \ldots, d_{N-1}$ |
| :---: | :---: |
| 1 | $\left[C_{0} C_{1} C_{2}\right]$ |
| 2 | $\left[C_{0} C_{1} C_{2} C_{0} C_{1} C_{2}\right]$ |
| 4 | $\left[\begin{array}{lll}c_{0} c_{1} \times \mathrm{XX} & c_{2} c_{0} \times \mathrm{X} C_{1} c_{2} \mathrm{XX}\end{array}\right]$ |
| 6 | $\left[c_{0} c_{1} \mathrm{XXXX} C_{2} c_{0} \mathrm{XXXX} C_{1} c_{2} \mathrm{XXXX}\right]$ |
| 8 |  |

The " $x$ " in Table 5.3.3.2-1 are placeholders for Clause 6.3.1.1 of [4, TS 38.211] to scramble the information bits in a way that maximizes the Euclidean distance of the modulation symbols carrying the information bits.

### 5.3.3.3 Encoding of other small block lengths

For $3 \leq K \leq 11$, the code block is encoded by $d_{i}=\left(\sum_{k=0}^{K-1} c_{k} \cdot M_{i, k}\right) \bmod 2$, where $i=0,1, \cdots, N-1, \quad N=32$,
and $\quad M_{i, k}$ represents the basis sequences as defined in Table 5.3.3.3-1.
Table 5.3.3.3-1: Basis sequences for (32, $K$ ) code

| i | $\mathrm{M}_{\mathrm{i}, 0}$ | $\mathrm{M}_{\mathrm{i}, 1}$ | $\mathrm{M}_{\mathrm{i}, 2}$ | $\mathrm{M}_{\mathrm{i}, 3}$ | $\mathrm{M}_{\mathrm{i}, 4}$ | $\mathrm{M}_{\mathrm{i}, 5}$ | $\mathrm{M}_{\mathrm{i}, 6}$ | $\mathrm{M}_{\mathrm{i}, 7}$ | $\mathrm{M}_{\mathrm{i}, \mathrm{8}}$ | $\mathrm{M}_{\mathrm{i}, 9}$ | $\mathrm{M}_{\mathrm{i}, 10}$ |

### 5.4 Rate matching

### 5.4.1 Rate matching for Polar code

The rate matching for Polar code is defined per coded block and consists of sub-block interleaving, bit collection, and bit interleaving. The input bit sequence to rate matching is $d_{0}, d_{1}, d_{2}, \ldots, d_{N-1}$. The output bit sequence after rate matching is denoted as $f_{0}, f_{1}, f_{2}, \ldots, f_{E-1}$.

### 5.4.1.1 Sub-block interleaving

The bits input to the sub-block interleaver are the coded bits $d_{0}, d_{1}, d_{2}, \ldots, d_{N-1}$. The coded bits $d_{0}, d_{1}, d_{2}, \ldots, d_{N-1}$ are divided into 32 sub-blocks. The bits output from the sub-block interleaver are denoted as $y_{0}, y_{1}, y_{2}, \ldots, y_{N-1}$, generated as follows:

$$
\text { for } \begin{aligned}
& n=0 \quad \text { to } \quad N-1 \\
& i=\langle 32 n / N\rfloor ; \\
& J(n)=P(i) \times(N / 32)+\bmod (n, N / 32) ; \\
& y_{n}=d_{J(n)} ;
\end{aligned}
$$

end for
where the sub-block interleaver pattern $\quad P(i) \quad$ is given by Table 5.4.1.1-1.
Table 5.4.1.1-1: Sub-block interleaver pattern $\quad P(i)$

| $i$ | $P(i)$ | $i$ | $P i$ | $i$ | $P(i)$ | $i$ | $P i$ | $i$ | $P i$ | $i$ | $P i$ | $i$ | $P(i)$ | $i$ | $P i i$ |
| :---: | :---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| 0 | 0 | 4 | 3 | 8 | 8 | 12 | 10 | 16 | 12 | 20 | 14 | 24 | 24 | 28 | 27 |
| 1 | 1 | 5 | 5 | 9 | 16 | 13 | 18 | 17 | 20 | 21 | 22 | 25 | 25 | 29 | 29 |
| 2 | 2 | 6 | 6 | 10 | 9 | 14 | 11 | 18 | 13 | 22 | 15 | 26 | 26 | 30 | 30 |
| 3 | 4 | 7 | 7 | 11 | 17 | 15 | 19 | 19 | 21 | 23 | 23 | 27 | 28 | 31 | 31 |

The sets of bit indices $\bar{Q}_{I}^{N}$ and $\bar{Q}_{F}^{N}$ are determined as follows, where $K, n_{P C}$, and $Q_{0}^{N-1}$ are defined in Clause 5.3.1

$$
\begin{aligned}
& \bar{Q}_{F, t m p}^{N}=\varnothing \\
& \text { if } \quad E<N \\
& \text { if } \quad K / E \leq 7 / 16 \quad \text {-- puncturing } \\
& \text { for } n=0 \quad \text { to } \quad N-E-1 \\
& \quad \bar{Q}_{F, t m p}^{N}=\bar{Q}_{F, t m p}^{N} \cup\{J(n)\}
\end{aligned}
$$

end for
if $E \geq 3 N / 4$

$$
\bar{Q}_{F, t m p}^{N}=\bar{Q}_{F, t m p}^{N} \cup\{0,1, \ldots,\{3 N / 4-E / 2]-1\} ;
$$

else

$$
\bar{Q}_{F, t m p}^{N}=\bar{Q}_{F, t m p}^{N} \cup\{0,1, \ldots,[9 N / 16-E / 4]-1\} ;
$$

end if
else -- shortening

$$
\text { for } n=E \text { to } N-1
$$

$$
\bar{Q}_{F, t m p}^{N}=\bar{Q}_{F, t m p}^{N} \cup(J(n)\} ;
$$

end for
end if
end if

$$
\bar{Q}_{I, t m p}^{N}=Q_{0}^{N-1}\left\{\bar{Q}_{F, t m p}^{N} i\right.
$$

$\bar{Q}_{I}^{N} \quad$ comprises $\quad\left(K+n_{P C}\right) \quad$ most reliable bit indices in $\quad \bar{Q}_{I, t m p}^{N}$;
$\bar{Q}_{F}^{N}=Q_{0}^{N-1}\left\{\bar{Q}_{I}^{N} \dot{i} ;\right.$

### 5.4.1.2 Bit selection

The bit sequence after the sub-block interleaver $y_{0}, y_{1}, y_{2}, \ldots, y_{N-1}$ from Clause 5.4.1.1 is written into a circular buffer of length $N$.

Denoting by $E$ the rate matching output sequence length, the bit selection output bit sequence $e_{k}$, $k=0,1,2, \ldots, E-1$, is generated as follows:
if $E \geq N \quad$-- repetition

$$
\text { for } k=0 \text { to } E-1
$$

$$
e_{k}=y_{\bmod (k, N)}
$$

end for else
if $K / E \leq 7 / 16 \quad$-- puncturing
for $k=0$ to $E-1$

$$
e_{k}=y_{k+N-E}
$$

end for
else -- shortening

$$
\text { for } k=0 \text { to } E-1
$$

$$
e_{k}=y_{k}
$$

end for
end if
end if

### 5.4.1.3 Interleaving of coded bits

The bit sequence $e_{0}, e_{1}, e_{2}, \ldots, e_{E-1}$ is interleaved into bit sequence $f_{0}, f_{1}, f_{2}, \ldots, f_{E-1}$, as follows:

If $I_{B L I}=1$
Denote $T$ as the smallest integer such that $T(T+1) / 2 \geq E$;

$$
k=0 \text {; }
$$

$$
\text { for } i=0 \quad \text { to } \quad T-1
$$

$$
\text { for } j=0 \text { to } T-1-i
$$

if $k<E$

$$
v_{i, j}=e_{k} ;
$$

else

$$
v_{i, j}=<\underset{i}{N U L L>i} ;
$$

end if

$$
k=k+1
$$

end for
end for

$$
k=0 \text {; }
$$

$$
\text { for } j=0 \text { to } T-1
$$

$$
\text { for } i=0 \text { to } T-1-j
$$

$$
\text { if } \underset{i}{v_{i, j} \neq i N U L L>i}
$$

$$
\begin{aligned}
& f_{k}=v_{i, j} ; \\
& k=k+1
\end{aligned}
$$

end if
end for
end for
else

$$
\text { for } \begin{aligned}
i=0 & \text { to } E-1 \\
& f_{i}=e_{i} ;
\end{aligned}
$$

end for
end if
The value of $E$ is no larger than 8192.

### 5.4.2 Rate matching for LDPC code

The rate matching for LDPC code is defined per coded block and consists of bit selection and bit interleaving. The input bit sequence to rate matching is $d_{0}, d_{1}, d_{2}, \ldots, d_{N-1}$. The output bit sequence after rate matching is denoted as $f_{0}, f_{1}, f_{2}, \ldots, f_{E-1}$.

### 5.4.2.1 Bit selection

The bit sequence after encoding $d_{0}, d_{1}, d_{2}, \ldots, d_{N-1}$ from Clause 5.3.2 is written into a circular buffer of length $N_{c b}$ for the $r$-th coded block, where $N$ is defined in Clause 5.3.2.

For the $\quad r \quad$-th code block, let $\quad N_{c b}=N \quad$ if $\quad I_{L B R M}=0 \quad$ and $\quad N_{c b}=\min \left(N, N_{r e f}\right) \quad$ otherwise, where $N_{\text {ref }}=\left\lfloor\frac{T B S_{\text {LBRM }}}{C \cdot R_{\text {LBRM }}}\right\rfloor, \quad R_{\text {LBRM }}=2 / 3 \quad, \quad T B S_{\text {LBRM }}$ is determined according to Clause 6.1.4.2 in [6, TS 38.214] for UL-SCH and Clause 5.1.3.2 in [6, TS 38.214] for DL-SCH/PCH, assuming the following:

- maximum number of layers for one TB for UL-SCH is given by X, where
- if the higher layer parameter maxMIMO-Layers of PUSCH-ServingCellConfig of the serving cell is configured, X is given by that parameter
- elseif the higher layer parameter maxRank of pusch-Config of the serving cell is configured, X is given by the maximum value of maxRank across all BWPs of the serving cell
- otherwise, X is given by the maximum number of layers for PUSCH supported by the UE for the serving cell
- maximum number of layers for one TB for DL-SCH/PCH is given by the minimum of X and 4 , where
- if the higher layer parameter maxMIMO-Layers of PDSCH-ServingCellConfig of the serving cell is configured, X is given by that parameter
- otherwise, X is given by the maximum number of layers for PDSCH supported by the UE for the serving cell
- if the higher layer parameter mcs-Table given by a pdsch-Config for at least one DL BWP of the serving cell is set to 'qam256', maximum modulation order $Q_{m}=8$ is assumed for DL-SCH; otherwise a maximum modulation order $Q_{m}=6$ is assumed for DL-SCH;
- if the higher layer parameter mcs-Table or mcs-TableTransformPrecoder given by a pusch-Config or configuredGrantConfig for at least one UL BWP of the serving cell is set to 'qam256', maximum modulation order $Q_{m}=8$ is assumed for UL-SCH; otherwise a maximum modulation order $Q_{m}=6$ is assumed for ULSCH
- maximum coding rate of 948/1024;
- $\quad n_{P R B}=n_{P R B, L B R M}$ is given by Table 5.4.2.1-1, where the value of $n_{P R B, L B R M}$ for DL-SCH is determined according to the initial downlink bandwidth part if there is no other downlink bandwidth part configured to the UE;
- $\quad N_{R E}=156 \widehat{P r}_{\text {PRB }}$;
- $C$ is the number of code blocks of the transport block determined according to Clause 5.2.2.

Table 5.4.2.1-1: Value of $n_{P R B, L B R M}$

| Maximum number of PRBs across all configured DL BWPs and UL BWPs of a carrier for DL- <br> SCH and UL-SCH, respectively | $n_{\text {PRB,LBRM }}$ |
| :---: | :---: |
| Less than 33 | 32 |
| 33 to 66 | 66 |
| 67 to 107 | 107 |
| 108 to 135 | 135 |
| 136 to 162 | 162 |
| 163 to 217 | 217 |
| Larger than 217 | 273 |

Denoting by $E_{r}$ the rate matching output sequence length for the $r$-th coded block, where the value of $E_{r}$ is determined as follows:

$$
\begin{aligned}
& \text { Set } j=0 \\
& \text { for } r=0 \text { to } C-1
\end{aligned}
$$

if the $\quad r$-th coded block is not scheduled for transmission as indicated by CBGTI according to Clause 5.1.7.2 for DL-SCH and 6.1.5.2 for UL-SCH in [6, TS 38.214]

$$
E_{r}=0 ;
$$

else

$$
\text { if } \quad j \leq C^{\prime}-\bmod \left(G /\left(N_{L} \cdot Q_{m}\right), C^{\prime}\right)-1
$$

$$
E_{r}=N_{L} \cdot Q_{m} \cdot\left\lfloor\frac{G}{N_{L} \cdot Q_{m} \cdot C^{\prime}}\right\rfloor
$$

else

$$
E_{r}=N_{L} \cdot Q_{m} \cdot\left[\frac{G}{N_{L} \cdot Q_{m} \cdot C^{\prime}}\right\rceil
$$

end if

$$
j=j+1
$$

end if
end for
where

- $\quad N_{L}$ is the number of transmission layers that the transport block is mapped onto;
- $\quad Q_{m}$ is the modulation order;
- $G$ is the total number of coded bits available for transmission of the transport block;
- $\quad C^{\prime}=C \quad$ if CBGTI is not present in the DCI scheduling the transport block and $C^{\prime}$ is the number of scheduled code blocks of the transport block if CBGTI is present in the DCI scheduling the transport block.

Denote by $\quad r V_{i d}$ the redundancy version number for this transmission ( $r V_{i d}=0,1,2$ or 3), the rate matching output bit sequence $e_{k}, \quad k=0,1,2, \ldots, E-1 \quad$, is generated as follows, where $k_{0}$ is given by Table 5.4.2.1-2 according to the value of $r \nu_{i d}$ and LDPC base graph:

$$
\begin{aligned}
& \text { k=0 ; } \\
& j=0 \text {; } \\
& \text { while } k<E \\
& \text { if } \\
& d_{\left(K_{0}+j\right) \bmod N_{c_{c o s}} \neq i} \text { NULL> } \\
& e_{k}=d_{\left(k_{0}+j\right) \bmod N_{c b}} \text {; } \\
& k=k+1 \text {; }
\end{aligned}
$$

end if

$$
j=j+1
$$

end while
Table 5.4.2.1-2: Starting position of different redundancy versions, $k_{0}$

| $r v_{i d}$ | $k_{0}$ |  |
| :---: | :---: | :---: |
|  | LDPC base graph 1 | LDPC base graph 2 |
| 0 | 0 | 0 |
| 1 | $\left\lfloor\frac{17 N_{c b}}{66 Z_{c}}\right\rfloor Z_{c}$ | $\left\lfloor\frac{13 N_{c b}}{50 Z_{c}}\right\rfloor Z_{c}$ |
| 2 | $\left\lfloor\frac{33 N_{c b}}{66 Z_{c}}\right\rfloor Z_{c}$ | $\left.\frac{25 N_{c b}}{50 Z_{c}}\right\rfloor Z_{c}$ |
| 3 | $\left\lfloor\frac{56 N_{c b}}{66 Z_{c}}\right\rfloor Z_{c}$ | $\left.\frac{43 N_{c b}}{50 Z_{c}}\right\rfloor Z_{c}$ |

### 5.4.2.2 Bit interleaving

The bit sequence $e_{0}, e_{1}, e_{2}, \ldots, e_{E-1}$ is interleaved to bit sequence $f_{0}, f_{1}, f_{2}, \ldots, f_{E-1}$, according to the following, where the value of $Q_{m}$ is the modulation order.

$$
\begin{aligned}
& \text { for } j=0 \quad \text { to } E / Q_{m}-1 \\
& \text { for } \quad i=0 \text { to } Q_{m}-1 \\
& f_{i+j \cdot Q_{m}}=e_{i E / Q_{m}+j}
\end{aligned}
$$

end for
end for

### 5.4.3 Rate matching for channel coding of small block lengths

The input bit sequence to rate matching is $d_{0}, d_{1}, d_{2}, \ldots, d_{N-1}$. The output bit sequence after rate matching is denoted as $f_{0}, f_{1}, f_{2}, \ldots, f_{E-1}$, where $E$ is the rate matching output sequence length. The bit sequence $f_{0}, f_{1}, f_{2}, \ldots, f_{E-1}$ is obtained by the following:
for $k=0$
to $E-1$

$$
f_{k}=d_{k \bmod N} ;
$$

end for

### 5.5 Code block concatenation

The input bit sequence for the code block concatenation block are the sequences $f_{r k}$, for $r=0, \ldots, C-1$ and $k=0, \ldots, E_{r}-1$, where $E_{r}$ is the number of rate matched bits for the $r$-th code block. The output bit sequence from the code block concatenation block is the sequence $g_{k}$ for $k=0, \ldots, G-1$.

The code block concatenation consists of sequentially concatenating the rate matching outputs for the different code blocks. Therefore,

Set $k=0$ and $r=0$
while $r<C$
Set $j=0$
while $j<E_{r}$

$$
\begin{aligned}
& g_{k}=f_{r j} \\
& k=k+1 \\
& j=j+1
\end{aligned}
$$

end while

$$
r=r+1
$$

end while

## 6 Uplink transport channels and control information

### 6.1 Random access channel

The sequence index for the random access channel is received from higher layers and is processed according to [4, TS 38.211].

### 6.2 Uplink shared channel

### 6.2.1 Transport block CRC attachment

Error detection is provided on each UL-SCH transport block through a Cyclic Redundancy Check (CRC).
The entire transport block is used to calculate the CRC parity bits. Denote the bits in a transport block delivered to layer 1 by $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$, and the parity bits by $p_{0}, p_{1}, p_{2}, p_{3}, \ldots, p_{L-1}$, where $A$ is the payload size and
$L$ is the number of parity bits. The lowest order information bit $a_{0}$ is mapped to the most significant bit of the transport block as defined in Clause 6.1.1 of [TS38.321].

The parity bits are computed and attached to the UL-SCH transport block according to Clause 5.1, by setting $L$ to 24 bits and using the generator polynomial $g_{\text {CRC24A }}(D) \quad$ if $\quad A>3824$; and by setting $L$ to 16 bits and using the generator polynomial $g_{\text {CRC16 }}(D)$ otherwise.

The bits after CRC attachment are denoted by $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$, where $B=A+L$.

### 6.2.2 LDPC base graph selection

For initial transmission of a transport block with coding rate $\quad R \quad$ indicated by the MCS index according to Clause 6.1.4.1 in [6, TS 38.214] and subsequent re-transmission of the same transport block, each code block of the transport block is encoded with either LDPC base graph 1 or 2 according to the following:

- if $A \leq 292$, or if $A \leq 3824$ and $R \leq 0.67$, or if $R \leq 0.25$, LDPC base graph 2 is used;
- otherwise, LDPC base graph 1 is used,
where $A$ is the payload size as described in Clause 6.2.1.

### 6.2.3 Code block segmentation and code block CRC attachment

The bits input to the code block segmentation are denoted by $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$ where $B$ is the number of bits in the transport block (including CRC).

Code block segmentation and code block CRC attachment are performed according to Clause 5.2.2.
The bits after code block segmentation are denoted by $c_{r 0}, c_{r 1}, c_{r 2}, c_{r 3}, \ldots, c_{r\left|K_{r}-1\right\rangle}$, where $r$ is the code block number and $K_{r}$ is the number of bits for code block number $\quad r \quad$ according to Clause 5.2.2.

### 6.2.4 Channel coding of UL-SCH

Code blocks are delivered to the channel coding block. The bits in a code block are denoted by
 number $\quad r$. The total number of code blocks is denoted by $C$ and each code block is individually LDPC encoded according to Clause 5.3.2.

After encoding the bits are denoted by

$$
d_{r 0}, d_{r 1}, d_{r 2}, d_{r 3}, \ldots, d_{r\left|N_{r}-1\right|} \text {, where the values of } \quad N_{r} \quad \text { is given in Clause }
$$ 5.3.2.

### 6.2.5 Rate matching

Coded bits for each code block, denoted as $d_{r 0}, d_{r 1}, d_{r 2}, d_{r 3}, \ldots, d_{r\left|N_{r}-1\right|}$, are delivered to the rate match block, where $r$ is the code block number, and $N_{r}$ is the number of encoded bits in code block number $r$. The total number of code blocks is denoted by $C$ and each code block is individually rate matched according to Clause 5.4.2 by setting $\quad I_{\text {LBRM }}=1$ if higher layer parameter rateMatching is set to limitedBufferRM and by setting $\quad I_{\text {LBRM }}=0$ otherwise.

After rate matching, the bits are denoted by $f_{r 0}, f_{r 1}, f_{r 2}, f_{r 3}, \ldots, f_{r\left|E_{r}-1\right|}$, where $E_{r}$ is the number of rate matched bits for code block number $r$.

### 6.2.6 Code block concatenation

The input bit sequence for the code block concatenation block are the sequences $f_{r 0}, f_{r 1}, f_{r 2}, f_{r 3}, \ldots, f_{r\left(E_{r}-1\right)}$, for $r=0, \ldots, C-1$ and where $E_{r}$ is the number of rate matched bits for the $r$-th code block.

Code block concatenation is performed according to Clause 5.5.

The bits after code block concatenation are denoted by $g_{0}, g_{1}, g_{2}, g_{3}, \ldots, g_{G-1}$, where $G$ is the total number of coded bits for transmission.

### 6.2.7 Data and control multiplexing

Denote the coded bits for UL-SCH as $g_{0}^{\mathrm{UL}-\mathrm{SCH}}, g_{1}^{\mathrm{UL}-\mathrm{SCH}}, g_{2}^{\mathrm{UL}-\mathrm{SCH}}, g_{3}^{\mathrm{UL}-\mathrm{SCH}}, \ldots, g_{G^{\mathrm{ULLSCH}} \mathrm{SCH}}^{-1}$.
Denote the coded bits for HARQ-ACK or jointly coded bits for HARQ-ACK and CG-UCI when the high layer parameter cg-UCI-Multiplexing is configured, if any, as $g_{0}^{\mathrm{ACK}}, g_{1}^{\mathrm{ACK}}, g_{2}^{\mathrm{ACK}}, g_{3}^{\mathrm{ACK}}, \ldots, g_{G^{\mathrm{ACK}}}^{-1}$.
Denote the coded bits for CSI part 1 , if any, as $g_{0}^{\text {CSI-part1 }}, g_{1}^{\text {CSI-part1 }}, g_{2}^{\text {CSI-part1 }}, g_{3}^{\text {CSI-part1 }}, \ldots, g_{G^{\text {CSI plpart1 }}-1}$.

$$
g_{0}^{\mathrm{CSI}-\mathrm{part} 2}, g_{1}^{\mathrm{CSI}-\mathrm{part} 2}, g_{2}^{\mathrm{CSI}-\mathrm{part} 2}, g_{3}^{\mathrm{CSI}-\mathrm{part} 2}, \ldots, g_{G^{\mathrm{CSII} \mathrm{ch}-\mathrm{par} 2}-1}
$$

Denote the coded bits for CSI part 2, if any, as
Denote the coded bits for CG-UCI without HARQ-ACK, if any, as

$$
g_{0}^{C G-U C I}, g_{1}^{C G-U C I}, g_{2}^{C G-U C I}, g_{3}^{C G-U C I}, \ldots, g_{G^{C G-U C I}-1}^{C G-U C}
$$

Denote the multiplexed data and control coded bit sequence as $g_{0}, g_{1}, g_{2}, g_{3}, \ldots, g_{G-1}$.
Denote $l$ as the OFDM symbol index of the scheduled PUSCH, starting from 0 to $N_{\text {symb,all }}^{\text {PUSCH }}-1$, where $\quad N_{\text {symb,dll }}^{\text {PUSCH }}$ is the total number of OFDM symbols of the PUSCH, including all OFDM symbols used for DMRS.

Denote $\quad k$ as the subcarrier index of the scheduled PUSCH, starting from 0 to $\quad M_{\mathrm{sc}}^{\mathrm{PUSCH}}-1$, where $\quad M_{\mathrm{sc}}^{\mathrm{PUSCH}}$ is expressed as a number of subcarriers.

Denote $\Phi_{l}^{\mathrm{UL}-\mathrm{SCH}}$ as the set of resource elements, in ascending order of indices $k$, available for transmission of data in OFDM symbol $l$, for $l=0,1,2, \ldots, N_{\text {symb,all }}^{\text {PUSCH }}-1$.

Denote ${ }^{M_{\mathrm{sc}}^{\mathrm{UL}-\mathrm{SCH}}(l)=\left|\Phi_{l}^{\mathrm{UL}-\mathrm{SCH}}\right|}$ as the number of elements in set $\Phi_{l}^{\mathrm{UL}-\mathrm{SCH}}$. Denote $\Phi_{l}^{\mathrm{UL}-\mathrm{SCH}}(j)$ as the $j$-th element in $\Phi_{l}^{\mathrm{UL}-\mathrm{SCH}}$

Denote $\Phi_{l}^{\text {UCI }}$ as the set of resource elements, in ascending order of indices $k$, available for transmission of UCI in OFDM symbol $l$, for $l=0,1,2, \ldots, N_{\text {symb,all }}^{\mathrm{PUSCH}}-1$. Denote ${ }^{M_{\mathrm{sc}}^{\mathrm{UCI}}(l)=\left|\Phi_{l}^{\mathrm{UCI}}\right|}$ as the number of elements in set $\Phi_{l}^{\mathrm{UCI}}$. Denote $\Phi_{l}^{\mathrm{UCI}}(j)$ as the $j$-th element in $\Phi_{l}^{\mathrm{UCI}}$. For any OFDM symbol that carriers DMRS of the PUSCH, $\Phi_{l}^{\mathrm{UCI}}=\geqslant$. For any OFDM symbol that does not carry DMRS of the PUSCH, $\Phi_{l}^{\mathrm{UCI}}=\Phi_{l}^{\mathrm{UL}-\mathrm{SCH}}$.

If frequency hopping is configured for the PUSCH,

- denote $l^{l^{11}}$ as the OFDM symbol index of the first OFDM symbol after the first set of consecutive OFDM symbol(s) carrying DMRS in the first hop;
- denote $l^{l^{(2)}}$ as the OFDM symbol index of the first OFDM symbol after the first set of consecutive OFDM symbol(s) carrying DMRS in the second hop.
- denote $l_{\mathrm{CSI}}^{(1)}$ as the OFDM symbol index of the first OFDM symbol that does not carry DMRS in the first hop;
- denote $l_{\text {CSI }}^{(2)}$ as the OFDM symbol index of the first OFDM symbol that does not carry DMRS in the second hop;
- if HARQ-ACK is present for transmission on the PUSCH with UL-SCH or if both HARQ-ACK and CG-UCI are present on the same PUSCH with UL-SCH, let

$$
-\quad G^{\mathrm{ACK}}(1)=N_{L} \cdot Q_{m} \cdot\left[G^{\mathrm{ACK}} /\left(2 \cdot N_{L} \cdot Q_{m}\right)\right] \quad \text { and } \quad G^{\mathrm{ACK}}(2)=N_{L} \cdot Q_{m} \cdot\left[G^{\mathrm{ACK}} /\left(2 \cdot N_{L} \cdot Q_{m}\right)\right]
$$

- if CSI is present for transmission on the PUSCH with UL-SCH, let

$$
\begin{aligned}
& \text { - } \quad G^{\text {CSI-part1 }}(1)=N_{L} \cdot Q_{m} \cdot\left[G^{\text {CSI-part1 }} /\left(2 \cdot N_{L} \cdot Q_{m}\right)\right] \text {; } \\
& \text { - } \quad G^{\mathrm{CSI}-\mathrm{part1}}(2)=N_{L} \cdot Q_{m} \cdot\left[G^{\mathrm{CSI}-\mathrm{part} 1} /\left(2 \cdot N_{L} \cdot Q_{m}\right)\right] \text {; } \\
& \text { - } \quad G^{\mathrm{CSI}-\mathrm{part} 2}(1)=N_{L} \cdot Q_{m} \cdot\left[G^{\mathrm{CSI}-\mathrm{part2} 2} /\left(2 \cdot N_{L} \cdot Q_{m}\right)\right] \text {; and } \\
& G^{\mathrm{CSI}-\mathrm{part} 2}(2)=N_{L} \cdot Q_{m} \cdot\left[G^{\mathrm{CSI}-\mathrm{part} 2} /\left(2 \cdot N_{L} \cdot Q_{m}\right)\right] ;
\end{aligned}
$$

- if CG-UCI is present for transmission on the PUSCH with UL-SCH and without HARQ-ACK, let

$$
\begin{aligned}
& G^{C G-U C I}(1)=N_{L} \cdot Q_{m} \cdot\left\lfloor G^{C G-U C I} /\left(2 \cdot N_{L} \cdot Q_{m}\right)\right\rfloor \text { and } \\
& \left.G^{C G-U C I}(2)=N_{L} \cdot Q_{m} \cdot \Gamma G^{C G-U C I} /\left(2 \cdot N_{L} \cdot Q_{m}\right)\right\rceil
\end{aligned}
$$

- if only HARQ-ACK and CSI part 1 are present for transmission on the PUSCH without UL-SCH, let

$$
\begin{aligned}
& G^{\mathrm{ACK}}(1)=\min \left(N_{L} \mathbf{Q}_{m}{ }^{\mathrm{ACK}} /\left(2 \boldsymbol{Q}_{L} \boldsymbol{Q}_{m}\right) M_{3} \hat{M}_{m}\right) ; \\
& \text { - } \quad G^{\mathrm{ACK}}(2)=G^{\mathrm{ACK}}-G^{\mathrm{ACK}}(1) \text {; } \\
& \text { - } \quad G^{\text {CII-part1 }}(1)=M_{1} \cdot N_{L} \cdot Q_{m}-G^{\text {ACK }}(1) \text {; and } \\
& \text { - } \quad G^{\text {CSI-part1 }}(2)=G^{\text {CSI-part1 }}-G^{\text {CSI-part1 }}(1) \text {; }
\end{aligned}
$$

- if HARQ-ACK, CSI part 1 and CSI part 2 are present for transmission on the PUSCH without UL-SCH, let

$$
\begin{array}{ll}
- & G^{\mathrm{ACK}}(1)=\min \left(N_{L} \hat{2}_{m}\right. \\
-\quad G^{\mathrm{ACK}}(2)=G^{\mathrm{ACK}}-G^{\mathrm{ACK}}(1)
\end{array}
$$

- if the number of HARQ-ACK information bits is more than 2 or if both HARQ-ACK and CG-UCI are present on the same PUSCH with UL-SCH, $G^{\text {CSI-part1 }}(1)=\min \left(N_{L} \cdot Q_{m} \cdot\left[G^{\mathrm{CSI}-\text { part1 }} /\left(2 \cdot N_{L} \cdot Q_{m}\right)\right], M_{1} \cdot N_{L} \cdot Q_{m}-G^{\text {ACK }}(1)\right)$; otherwise, $\left.G^{\text {CSI-part1 }}(1)=\min \left(N_{L} \boldsymbol{Q}_{m}{ }^{\text {CSI-part1 }} /\left(2 \boldsymbol{Q}_{L}\right\rangle_{m}\right) M_{1} \boldsymbol{Q}_{m}-G_{r r d}^{\text {ACK }}(1)\right)$
- $\quad G^{\text {CSI-part }}(2)=G^{\text {CSI-part1 }}-G^{\text {CSI-part1 }}(1)$;
- $\quad G^{\mathrm{CSI}-\text { part2 }}(1)=M_{1} \cdot N_{L} \cdot Q_{m}-G^{\mathrm{CSI}-\text { part1 }}(1) \quad$ if the number of HARQ-ACK information bits is no more than 2, and $G^{\mathrm{CSI}-\mathrm{part2}}(1)=M_{1} \cdot N_{L} \cdot Q_{m}-G^{\mathrm{ACK}}(1)-G^{\mathrm{CSI}-\mathrm{part} 1}(1) \quad$ otherwise; and
- $\quad G^{\mathrm{CSI}-\text { part2 }}(2)=M_{2} \cdot N_{L} \cdot Q_{m}-G^{\mathrm{CSI}-\text { part1 }}(2) \quad$ if the number of HARQ-ACK information bits is no more than 2, and $G^{\mathrm{CSI}-\text { part2 }}(2)=M_{2} \cdot N_{L} \cdot Q_{m}-G^{\mathrm{ACK}}(2)-G^{\mathrm{CSI}-\text { part1 }}(2) \quad$ otherwise;
- if CG-UCI is present for transmission on the PUSCH with UL-SCH and without HARQ-ACK, let

$$
\begin{array}{ll}
\left.-\quad G^{C S I-p a r t 1}(1)=\min \left(N_{L} \cdot Q_{m} \cdot l G^{C S I-p a r t ~ 1} /\left(2 \cdot N_{L} \cdot Q_{m}\right)\right\rfloor, M_{1} \cdot N_{L} \cdot Q_{m}-G^{C G-U C I}(1)\right) \\
-\quad G^{C S I-\text { part } 1}(2)=G^{C S I-\text { part } 1}-G^{C S I-\text { part } 1}(1)
\end{array}
$$

- $\quad G^{\text {CSI-part2 }}(1)=M_{1} \cdot N_{L} \cdot Q_{m}-G^{\text {CG-UCI }}(1)-G^{\text {CSI-part } 1}(1)$; and
- $\quad G^{\text {CSI-part } 2}(2)=M_{2} \cdot N_{L} \cdot Q_{m}-G^{\text {CG-UCI }}(2)-G^{\text {CSI-part } 1}(2)$;
- if CSI part 1 and CSI part 2 are present for transmission on the PUSCH without UL-SCH, let

- $G^{\text {CSI-part }}(2)=G^{\text {CSI-part1 }}-G^{\text {CSI-part }}(1)$;
- $\quad G^{\text {CSIpart2 }}(1)=M_{1} \cdot N_{L} \cdot Q_{m}-G^{\text {CSLpart1 }}(1)$; and
- $\quad G^{\text {CSI-part2 }}(2)=M_{2} \cdot N_{L} \cdot Q_{m}-G^{\text {CSI-part1 }}(2)$;
- let $N_{\text {hop }}^{\text {PUSCH }}=2$, and denote $N_{\text {symblhop }}^{\text {PUSCH }}(1), N_{\text {symb,hop }}^{\text {PUSCC }}(2)$ as the number of OFDM symbols of the PUSCH in the first and second hop, respectively;
- $N_{L}$ is the number of transmission layers of the PUSCH;
- $Q_{m}$ is the modulation order of the PUSCH;

If frequency hopping is not configured for the PUSCH,

- denote $l^{(1)}$ as the OFDM symbol index of the first OFDM symbol after the first set of consecutive OFDM symbol(s) carrying DMRS;
- denote $l_{\text {CSI }}^{(1)}$ as the OFDM symbol index of the first OFDM symbol that does not carry DMRS;
- if HARQ-ACK is present for transmission on the PUSCH or if both HARQ-ACK and CG-UCI are present on the same PUSCH with UL-SCH, let $\quad G^{A C K}(1)=G^{A C K}$;
- if CSI is present for transmission on the PUSCH, let $G^{\text {CSI-part1 }}(1)=G^{\text {CSI-part1 }}$ and $G^{\text {CSI-part2 }}(1)=G^{\text {CSLpart2 }}$;
- if CG-UCI is present for transmission on the PUSCH without HARQ-ACK, let $\quad G^{C G-U C I}(1)=G^{C G-U C I}$; - let $N_{\text {hop }}^{\text {PUSCH }}=1$ and $N_{\text {symb,bop }}^{\text {PUSH }}(1)=N_{\text {symb,all }}^{\text {PUSCH }}$.

The multiplexed data and control coded bit sequence $g_{0}, g_{1}, g_{2}, g_{3}, \ldots, g_{G-1} \quad$ is obtained according to the following:

## Step 1:

Set $\bar{\Phi}_{l}^{\text {UL-SCH }}=\Phi_{l}^{\text {UL-SCH }}$ for $\quad l=0,1,2, \ldots, N_{\text {symb, }, \text { ll }}^{\text {PUSCH }}-1$;

Set $\overline{\bar{M}}_{\mathrm{sc}}^{\mathrm{UC} \text {-SCH }}(l)=\left|\bar{\Phi}_{l}^{\mathrm{UL} \text {-SCH }}\right|$ for $\quad l=0,1,2, \ldots, N_{\mathrm{symb}, \mathrm{all}}^{\mathrm{PUSH}}-1$;
Set $\bar{\Phi}_{l}^{\mathrm{UCl}}=\Phi_{l}^{\text {UCI }}$ for $l=0,1,2, \ldots, N_{\text {symb,all }}^{\mathrm{PUSCH}}-1$;
Set $\bar{M}_{\mathrm{sc}}^{\mathrm{UCl}}(l)=\left|\bar{\Phi}_{l}^{\mathrm{UCl}}\right|{ }_{\text {for }} \quad l=0,1,2, \ldots, N_{\text {symblall }}^{\mathrm{PUSCH}}-1$;
if the number of HARQ-ACK information bits to be transmitted on PUSCH is 0 , 1 or 2 bits and without CG-UCI the number of reserved resource elements for potential HARQ-ACK transmission is calculated according to Clause 6.3.2.4.2.1, by setting $O_{\text {АСК }}=2$;
denote $G_{\mathrm{wd}}^{\text {ACK }}$ as the number of coded bits for potential HARQ-ACK transmission using the reserved resource elements;
if frequency hopping is configured for the PUSCH, let $G_{\mathrm{Nd}}^{\mathrm{ACK}}(1)=N_{L} \omega_{m} \mathrm{ACd} /\left(2 \omega_{L}\right)$ and

$$
G_{\mathrm{nd}}^{\mathrm{ACK}}(2)=N_{L} \hat{W}_{m} \hat{\mathrm{~N}}_{\mathrm{vd}}^{\mathrm{ACK}} /\left(2 \hat{W}_{L} \hat{Q}_{m}\right)
$$

if frequency hopping is not configured for the PUSCH, let $G_{\mathrm{vd}}^{\text {ACK }}(1)=G_{\mathrm{vd}}^{\mathrm{Ack}}$;
denote $\bar{\Phi}_{l}^{\text {rd }}$ as the set of reserved resource elements for potential HARQ-ACK transmission, in OFDM symbol $l$, for $l=0,1,2, \ldots, N_{\text {symb, } 1 \mathrm{ll}}^{\mathrm{PUSCH}}-1$;

Set $m_{\text {count }}^{\text {ACK }}(1)=0$;
Set $m_{\text {count }}^{\text {ACK }}(2)=0$;

$$
\bar{\Phi}_{l}^{\text {rvd }}=\varnothing \quad \text { for } \quad l=0,1,2, \ldots, N_{\text {symb }, a l l}^{\mathrm{PUSCCH}}-1 ;
$$

for $i=1$ to $N_{\text {hop }}^{\text {PUSCH }}$

### 6.3 Uplink control information

### 6.3.1 Uplink control information on PUCCH

The procedure in this clause applies to PUCCH formats 2/3/4.

### 6.3.1.1 UCI bit sequence generation

### 6.3.1.1.1 HARQ-ACK/SR only

If only HARQ-ACK bits are transmitted on a PUCCH, the UCI bit sequence $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$ is determined by

If only HARQ-ACK and SR bits are transmitted on a PUCCH, the UCI bit sequence $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$ is determined by setting $a_{i}=\widetilde{o}_{i}^{A C K}$ for $i=0,1, \ldots, O^{\mathrm{ACK}}-1, a_{i}=\widetilde{o}_{i-O^{A C K}}^{S R}$ for $i=O^{\mathrm{ACK}}, 0^{\mathrm{ACK}}+1, \ldots, 0^{\mathrm{ACK}}+O^{\mathrm{SR}}-1$, and $A=O^{\mathrm{ACK}}+O^{\mathrm{SR}}$, where the HARQ-ACK bit sequence
 given by Clause 9.2.5.1 of [5, TS 38.213].

### 6.3.1.1.2 CSI only

The bitwidth for PMI of codebookType=typeI-SinglePanel with 2 CSI-RS ports is 2 for Rank=1 and 1 for Rank=2, according to Clause 5.2.2.2.1 in [6, TS 38.214].

The bitwidth for PMI of codebookType=typeI-SinglePanel with more than 2 CSI-RS ports is provided in Tables 6.3.1.1.2-1, where the values of $\left(N_{1}, N_{2}\right)$ and $\left(O_{1}, O_{2}\right)$ are given by Clause 5.2.2.2.1 in [6, TS 38.214].

| Subband differential CQI | 2 |
| Indicator of the number of non-zero <br> wideband amplitude coefficients $M_{l}$ for <br> layer $l$ | $\left\lceil\log _{2}(2 L-1)\right\rceil$ |

where $n_{R I}$ is the number of allowed rank indicator values according to Clauses 5.2.2.2.3 and 5.2.2.2.4 [6, TS 38.214] and $v$ is the value of the rank. The values of the rank indicator field are mapped to allowed rank indicator values with increasing order, where ' 0 ' is mapped to the smallest allowed rank indicator value.

The bitwidth for CRI, SSBRI, RSRP, and differential RSRP are provided in Table 6.3.1.1.2-6.
Table 6.3.1.1.2-6: CRI, SSBRI, and RSRP

| Field | Bitwidth |
| :---: | :---: |
| CRI | $\left\lceil\log _{2}\left(K_{s}^{\mathrm{CSI}-\mathrm{RS}}\right)\right\rceil$ |
| SSBRI | $\left\lceil\log _{2}\left(K_{s}^{\mathrm{SSB}}\right)\right\rceil$ |
| RSRP | 7 |
| Differential RSRP | 4 |

$\begin{array}{ll}\text { where } & K_{s}^{\text {CSI-RS }} \text { is the number of CSI-RS resources in the corresponding resource set, and } \\ \text { configured number of } \mathrm{SS} / \mathrm{PBCH} \text { blocks in the } & K_{s}^{\text {SSB }}\end{array}$ is the configured number of SS/PBCH blocks in the corresponding resource set for reporting 'ssb-Index-RSRP'.

Table 6.3.1.1.2-6A: CRI, SSBRI, and SINR

| Field | Bitwidth |
| :---: | :---: |
| CRI | $\left.\Gamma \log _{2}\left(K_{s}^{C S I-R S}\right)\right\rceil$ |
| SSBRI | $\left.\Gamma \log _{2}\left(K_{s}^{S S B}\right)\right\rceil$ |
| SINR | 7 |
| Differential SINR | 4 |

where $K_{s}^{C S I-R S}$ is the number of CSI-RS resources in the corresponding resource set, and $K_{s}^{S S B}$ is the configured number of SS/PBCH blocks in the corresponding resource set for reporting 'ssb-Index-SINR'.

Table 6.3.1.1.2-7: Mapping order of CSI fields of one CSI report, pmi-FormatIndicator=widebandPMI and cqi-FormatIndicator=widebandCQI

| CSI report number | CSI fields |
| :---: | :---: |
| CSI report \#n | CRI as in Tables 6.3.1.1.2-3/4, if reported |
|  | Rank Indicator as in Tables 6.3.1.1.2-3/4, if reported |
|  | Layer Indicator as in Tables 6.3.1.1.2-3/4, if reported |
|  | Zero padding bits $O_{P}$, if needed |
|  | PMI wideband information fields $X_{1}$, from left to right as in Tables 6.3.1.1.2-1/2, if reported |
|  | PMI wideband information fields $X_{2}$, from left to right as in Tables 6.3.1.1.2-1/2, or codebook index for 2 antenna ports according to Clause 5.2.2.2.1 in [6, TS38.214], if reported |
|  | Wideband CQI for the first TB as in Tables 6.3.1.1.2-3/4, if reported |
|  | Wideband CQI for the second TB as in Tables 6.3.1.1.2-3/4, if reported |

The number of zero padding bits $O_{P}$ in Table 6.3.1.1.2-7 is 0 for 1 CSI-RS port and $O_{P}=N_{\text {max }}-N_{\text {reported }}$ for more than 1 CSI-RS port, where

- $\quad N_{\max }=\max _{r \in S_{\text {Rank }}} B(r)$ and $S_{\text {Rank }}$ is the set of rank values $r$ that are allowed to be reported;
- $\quad N_{\text {reported }}=B(R)$, where $R$ is the reported rank;
- For 2 CSI-RS ports,

$$
B(r)=N_{\mathrm{PMI}}(r)+N_{\mathrm{CQI}}(r)+N_{\mathrm{LI}}(r)
$$

- For more than 2 CSI-RS ports, $\quad B(r)=N_{\text {PMI,i1 }}(r)+N_{\text {PMI,i2 }}(r)+N_{\mathrm{CQI}}(r)+N_{\mathrm{LI}}(r)$;
- if PMI is reported, $\quad N_{\text {PMI }}(1)=2$ and $\quad N_{\text {PMI }}(2)=1$; otherwise, $\quad N_{\text {PMI }}(r)=0$;
- if PMI $\quad i 1$ is reported, $\quad N_{\text {PMI,i1 }}|r|$ is obtained according to Tables 6.3.1.1.2-1/2; otherwise, $\quad N_{\text {PMI,i1 }}|r|=0$;
- if PMI i2 is reported, $\quad N_{\text {PMI,i2 }}|r|$ is obtained according to Tables 6.3.1.1.2-1/2; otherwise, $\quad N_{\text {PMI,i2 }}|r|=0$;
- if CQI is reported, $\quad N_{\text {CQI }}(r)$ is obtained according to Tables 6.3.1.1.2-3/4; otherwise, $\quad N_{\text {CQI }}(r)=0 \quad$;
- if LI is reported, $N_{\mathrm{LI}}(r)$ is obtained according to Tables 6.3.1.1.2-3/4; otherwise, $\quad N_{\mathrm{LI}}(r)=0$.

| :---: | :---: |
|  | PMI subband information fields $X_{2}$ of all even subbands with increasing order of subband number, from left to right as in Tables 6.3.1.1.2-1/2, or codebook index for 2 antenna ports according to Clause 5.2.2.2.1 in [6, TS38.214] of all even subbands with increasing order of subband number, if pmi-FormatIndicator= subbandPMI and if reported |
|  | Subband differential CQI for the second TB of all odd subbands with increasing order of subband number, as in Tables 6.3.1.1.2-3/4/5, if cqi-FormatIndicator=subbandCQI and if reported |
|  | PMI subband information fields $X_{2}$ of all odd subbands with increasing order of subband number, from left to right as in Tables 6.3.1.1.2-1/2, or codebook index for 2 antenna ports according to Clause 5.2.2.2.1 in [6, TS38.214] of all odd subbands with increasing order of subband number, if pmi-FormatIndicator= subbandPMI and if reported |
| Note: $\quad$ Sub | ds for given CSI report $n$ indicated by the higher layer parameter csi-ReportingBand are numbere ously in the increasing order with the lowest subband of csi-ReportingBand as subband 0. |

If none of the CSI reports for transmission on a PUCCH is of two parts, the CSI fields of all CSI reports, in the order from upper part to lower part in Table 6.3.1.1.2-12, are mapped to the UCI bit sequence $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$ starting with $a_{0}$. The most significant bit of each field is mapped to the lowest order information bit for that field, e.g. the most significant bit of the first field is mapped to
$a_{0}$
Table 6.3.1.1.2-12: Mapping order of CSI reports to UCI bit sequence $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$, without two-part CSI report(s)

| UCI bit sequence | CSI report number |
| :---: | :---: |
| $a_{0}$ | CSI report \#1 <br> $a_{1}$ <br> $a_{2}$ <br> $a_{3}$ <br> $\vdots$ |
| as in Table 6.3.1.1.2-7/8 |  |
| $a_{A-1}$ | $\ldots$ |
|  | as in Table 6.3.1.1.2-7/8 |

If at least one of the CSI reports for transmission on a PUCCH is of two parts, two UCI bit sequences are generated, $a_{0}^{(1)}, a_{1}^{(1)}, a_{2}^{(1)}, a_{3}^{(1)}, \ldots, a_{A^{(1)}-1}^{(1)}$ and $a_{0}^{(2)}, a_{1}^{(2)}, a_{2}^{(2)}, a_{3}^{(2)}, \ldots, a_{A^{(2)}-1}^{(2)}$. The CSI fields of all CSI reports, in the order from upper part to lower part in Table 6.3.1.1.2-13, are mapped to the UCI bit sequence $a_{0}^{(1)}, a_{1}^{(1)}, a_{2}^{(1)}, a_{3}^{(1)}, \ldots, a_{A^{(1)}-1}^{(1)}$ starting with $\quad a_{0}^{(1)}$. The most significant bit of each field is mapped to the lowest order information bit for that field, e.g. the most significant bit of the first field is mapped to $a_{0}^{(1)}$. The CSI fields of all CSI reports, in the order from upper part to lower part in Table 6.3.1.1.2-14, are mapped to the UCI bit sequence $a_{0}^{(2)}, a_{1}^{(2)}, a_{2}^{(2)}, a_{3}^{(2)}, \ldots, a_{A^{(2)}-1}^{\text {(2) }}$ starting with $a_{0}^{(2)}$. The most significant bit of each field is mapped to the lowest order information bit for that field, e.g. the most significant bit of the first field is mapped to $a_{0}^{(2)}$. If the length of UCI bit sequence $a_{0}^{(2)}, a_{1}^{(2)}, a_{2}^{(2)}, a_{3}^{(2)}, \ldots, a_{A^{(2)}-1}^{(2)}$ is less than 3 bits, zeros shall be appended to the UCI bit sequence until its length equals 3 .

Table 6.3.1.1.2-13: Mapping order of CSI reports to UCI bit sequence $a_{0}^{(1)}, a_{1}^{(1)}, a_{2}^{(1)}, a_{3}^{(1)}, \ldots, a_{A^{(1)}-1}^{(1)}$, with two-part CSI report(s)

| UCI bit sequence | CSI report number |
| :---: | :---: |

where CSI report \#1, CSI report \#2, ..., CSI report \#n in Table 6.3.1.1.2-13 correspond to the CSI reports in increasing order of CSI report priority values according to Clause 5.2 .5 of [6, TS38.214].

Table 6.3.1.1.2-14: Mapping order of CSI reports to UCI bit sequence with two-part CSI report(s)

| UCI bit sequence | CSI report number |

|  | CSI report \#1, CSI part 2 subband, as in Table 6.3.1.1.2-11 if CSI part 2 exists for CSI report \#1 |
|  | CSI report \#2, CSI part 2 subband, as in Table 6.3.1.1.2-11 if CSI part 2 exists for CSI report \#2 |
|  | ... |
|  | CSI report \#n, CSI part 2 subband, as in Table 6.3.1.1.2-11 if CSI part 2 exists for CSI report \#n |

where CSI report \#1, CSI report \#2, ..., CSI report \#n in Table 6.3.1.1.2-14 correspond to the CSI reports in increasing order of CSI report priority values according to Clause 5.2 .5 of [6, TS38.214].

### 6.3.1.1.3 HARQ-ACK/SR and CSI

If none of the CSI reports for transmission on a PUCCH is of two parts, the UCI bit sequence $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$ is generated according to the following, where $A=O^{\mathrm{ACK}}+O^{\mathrm{SR}}+O^{\mathrm{CSI}}$ :

- if there is HARQ-ACK for transmission on the PUCCH, the HARQ-ACK bits are mapped to the UCI bit sequence $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{0^{A C K}}^{-1}{ }^{\text {, where }} a_{i}=\widetilde{o}_{i}^{\text {ACK }}$ for $i=0,1, \ldots, O^{\text {ACK }}-1$, the HARQ-ACK bit sequence $\tilde{0}_{0}^{A C K},\left\{\left\{_{1}^{A C K}, \ldots, \tilde{0}_{0^{A C K}}{ }^{A C K} i \quad\right.\right.$ is given by Clause 9.1 of [5, TS38.213], and $O^{\text {ACK }}$ is number of HARQ-ACK bits; if there is no HARQ-ACK for transmission on the PUCCH, set $O^{\text {ACK }}=0$;
- if there is SR for transmission on the PUCCH, set $a_{i}=\tilde{o}_{i-O^{A C K}}^{S R} \quad$ for $\quad i=0^{\mathrm{ACK}}, 0^{\mathrm{ACK}}+1, \ldots, 0^{\mathrm{ACK}}+O^{\mathrm{SR}}-1$, where the SR bit sequence $\stackrel{\sim}{0}_{0}^{\text {SR }},\left\{\left\{_{0}^{\sim S R}, \ldots, \tilde{0}_{0_{S R}^{S R}}^{\sim} i\right.\right.$ is given by Clause 9.2.5.1 of [5, TS 38.213]; if there is no SR for transmission on the PUCCH, set $\quad O^{\mathrm{SR}}=0$;
- the CSI fields of all CSI reports, in the order from upper part to lower part in Table 6.3.1.1.2-12, are mapped to
 the number of CSI bits.

If at least one of the CSI reports for transmission on a PUCCH is of two parts, two UCI bit sequences are generated, $a_{0}^{(1)}, a_{1}^{(1)}, a_{2}^{(1)}, a_{3}^{(1)}, \ldots, a_{A^{(1)}-1}^{(1)}$ and $a_{0}^{(2)}, a_{1}^{(2)}, a_{2}^{(2)}, a_{3}^{(2)}, \ldots, a_{A^{(2)}-1}^{(2)}$, according to the following, where $A^{(1)}=O^{\mathrm{ACK}}+O^{\mathrm{SR}}+O^{\mathrm{CSI}-\text { part1 }}$ and $A^{(2)}=O^{\mathrm{CSI} \text {-part2 }}$ :

- if there is HARQ-ACK for transmission on the PUCCH, the HARQ-ACK bits are mapped to the UCI bit sequence $a_{0}^{(1)}, a_{1}^{(1)}, a_{2}^{(1)}, a_{3}^{(1)}, \ldots, a_{0^{\text {ACK }}}^{-1}(1)$, where $a_{i}^{(1)}=\tilde{o}_{i}^{\text {ACK }}$ for $i=0,1, \ldots, O^{\text {ACK }}-1$, the HARQ-ACK bit sequence $\tilde{0}_{0}^{A C K},\left\{\tilde{0}_{1}^{A C K}, \ldots, \tilde{0}_{0^{A C K}}{ }_{-1}^{i}{ }^{i}\right.$ is given by Clause 9.1 of [5, TS38.213], and $O^{A C K}$ is number of HARQACK bits; if there is no HARQ-ACK for transmission on the PUCCH, set $\quad O^{\text {ACK }}=0$;
- if there is SR for transmission on the PUCCH, set $a_{i}=\tilde{o}_{i-O^{A C K}}^{S R}$ for $i=O^{\mathrm{ACK}}, O^{\mathrm{ACK}}+1, \ldots, 0^{\mathrm{ACK}}+0^{\mathrm{SR}}-1$, where the SR bit sequence $\quad \stackrel{\sim}{\sim_{0}^{S R}},\left\{\tilde{0}_{1}^{S R}, \ldots, \tilde{0}_{0^{S R}-1}^{\sim S R}\right.$ is given by Clause 9.2.5.1 of [5, TS 38.213]; if there is no SR for transmission on the PUCCH, set $\quad O^{\mathrm{SR}}=0$;
- the CSI fields of all CSI reports, in the order from upper part to lower part in Table 6.3.1.1.2-13, are mapped to
 the number of CSI bits in CSI part 1 of all CSI reports;
- the CSI fields of all CSI reports, in the order from upper part to lower part in Table 6.3.1.1.2-14, are mapped to the UCI bit sequence $a_{0}^{(2)}, a_{1}^{(2)}, a_{2}^{(2)}, a_{3}^{(2)}, \ldots, a_{A^{(2)}-1}^{(2)} \quad$ starting with $a_{0}^{(2)}$, where $O^{\text {CSI-part2 }}$ is the number of CSI bits in CSI part 2 of all CSI reports. If the length of UCI bit sequence $a_{0}^{(2)}, a_{1}^{(2)}, a_{2}^{(2)}, a_{3}^{(2)}, \ldots, a_{A^{(2)}-1}^{(2)}$ is less than 3 bits, zeros shall be appended to the UCI bit sequence until its length equals 3 .

### 6.3.1.2 Code block segmentation and CRC attachment

The UCI bit sequence from clause 6.3.1.1 is denoted by $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$, where $A$ is the payload size. The procedure in 6.3.1.2.1 applies for $A \geq 12$ and the procedure in Clause 6.3.1.2.2 applies for $A \leq 11$

### 6.3.1.2.1 UCI encoded by Polar code

If the payload size $A \geq 12$, code block segmentation and CRC attachment is performed according to Clause 5.2.1. If ( $A \geq 360$ and $E \geq 1088$ ) or if $A<13, I_{\text {seg }}=1$; otherwise $I_{\text {seg }}=0$, where $E$ is the rate matching output sequence length as given in Clause 6.3.1.4.1.

If $12 \leq A \leq 19$, the parity bits $\quad p_{r 0}, p_{r 1}, p_{r 2}, \ldots, p_{r(L-1)} \quad$ in Clause 5.2 .1 are computed by setting $L \quad$ to 6 bits and using the generator polynomial $g_{\text {CRC6 }}(D)$ in Clause 5.1, resulting in the sequence $c_{r 0}, c_{r 1}, c_{r 2}, c_{r 3}, \ldots, c_{r\left(K_{r}-1\right)}$ where $r$ is the code block number and $K_{r}$ is the number of bits for code block number $r$.

If $A \geq 20$, the parity bits $\quad p_{r 0}, p_{r 1}, p_{r 2}, \ldots, p_{r(L-1)} \quad$ in Clause 5.2.1 are computed by setting $L$ to 11 bits and using the generator polynomial $g_{\mathrm{CRC11}}(D)$ in Clause 5.1, resulting in the sequence $c_{r 0}, c_{r 1}, c_{r 2}, c_{r 3}, \ldots, c_{r\left|K_{r}-1\right|}$ where
$r$ is the code block number and $K_{r}$ is the number of bits for code block number $r$.

### 6.3.1.2.2 UCI encoded by channel coding of small block lengths

If the payload size $A \leq 11, \mathrm{CRC}$ bits are not attached.
The output bit sequence is denoted by $c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{K-1}$, where $c_{i}=a_{i}$ for $i=0,1, \ldots, A-1$ and $K=A$.

### 6.3.1.3 Channel coding of UCI

### 6.3.1.3.1 UCI encoded by Polar code

Information bits are delivered to the channel coding block. They are denoted by

$$
c_{r 0}, c_{r 1}, c_{r 2}, c_{r 3}, \ldots, c_{r\left(K_{r}-1\right)} \text {, where }
$$ $r$ is the code block number, and $K_{r}$ is the number of bits in code block number $r$. The total number of code blocks is denoted by $C$ and each code block is individually encoded by the following:

If $18 \leq K_{r} \leq 25$, the information bits are encoded via Polar coding according to Clause 5.3.1, by setting $n_{\max }=10, I_{I L}=0, n_{P C}=3, n_{P C}^{w m}=1$ if $E_{r}-K_{r}+3>192$ and $n_{P C}^{w m}=0$ if $E_{r}-K_{r}+3 \leq 192$,
where $E_{r}$ is the rate matching output sequence length as given in Clause 6.3.1.4.1.
If $K_{r}>30$, the information bits are encoded via Polar coding according to Clause 5.3.1, by setting $n_{\max }=10$, $I_{I L}=0, n_{P C}=0$, and $n_{P C}^{w m}=0$

After encoding the bits are denoted by

$$
d_{r 0}, d_{r 1}, d_{r 2}, d_{r 3}, \ldots, d_{r\left(N_{r}-1\right)} \text {, where } \quad N_{r} \quad \text { is the number of coded bits in code }
$$ block number $r$

### 6.3.1.3.2 UCI encoded by channel coding of small block lengths

Information bits are delivered to the channel coding block. They are denoted by $c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{K-1}$, where $K$ is the number of bits.

The information bits are encoded according to Clause 5.3.3.
After encoding the bits are denoted by $d_{0}, d_{1}, d_{2}, d_{3}, \ldots, d_{N-1}$, where $N$ is the number of coded bits.

### 6.3.1.4 Rate matching

For PUCCH formats 2/3/4, the total rate matching output sequence length $E_{\text {tot }}$ is given by Table 6.3.1.4-1, where $N_{\text {symb, UCI }}^{\text {PUCCH } 2} \quad, \quad N_{\text {symb, UCI }}^{\text {PUCCH }}$, , and $\quad N_{\text {symb, UCI }}^{\text {PUCCH, }} \quad$ are the number of symbols carrying UCI for PUCCH formats $2 / 3 / 4$ respectively; $N_{\mathrm{PRB}}^{\mathrm{PUCCH}, 2}$ and $N_{\mathrm{PRB}}^{\mathrm{PUCCH}, 3}$ are the number of PRBs that are determined by the UE for PUCCH formats 2/3 transmission respectively according to Clause 9.2 of [5, TS38.213]; and $N_{S F}^{P U C C H, 2}, N_{S F}^{P U C C H, 3}$, and $N_{\mathrm{SF}}^{\mathrm{PUCCH}, 4}$ are the spreading factors for PUCCH format 2, PUCCH format 3, and PUCCH format 4, respectively.

Table 6.3.1.4-1: Total rate matching output sequence length $E_{\text {tot }}$

| PUCCH format | Modulation order |  |
| :---: | :---: | :---: |
|  | QPSK | п/2-BPSK |
| PUCCH format 2 | $16 \cdot N_{\text {symb, UCI }}^{P U C C H, 2} \cdot N_{P R B}^{P U C C H, 2} / N_{S F}^{P U C C H, 2}$ | N/A |
| PUCCH format 3 | $24 \cdot N_{\text {symb }, U C I}^{P U C C H, 3} \cdot N_{P R B}^{P U C C H, 3} / N_{S F}^{P U C C H, 3}$ | $12 \cdot N_{s y m b, U C I}^{P U C C H, 3} \cdot N_{P R B}^{\text {PUCCH }, 3} / N_{S F}^{P U C C}$ |
| PUCCH format 4 | $24 \cdot N_{\mathrm{symb}, \mathrm{UCI}}^{\mathrm{PUCCH}, 4} / N_{\mathrm{SF}}^{\mathrm{PUCCH}, 4}$ | $12 \cdot N_{\mathrm{symb}, \mathrm{UCl}}^{\mathrm{PUCCH}, 4} / N_{\mathrm{SF}}^{\mathrm{PUCCH}, 4}$ |

### 6.3.1.4.1 UCI encoded by Polar code

The input bit sequence to rate matching is $d_{r 0}, d_{r 1}, d_{r 2}, d_{r 3}, \ldots, d_{r\left(N_{r}-1\right)}$ where $r$ is the code block number, and $N_{r}$ is the number of coded bits in code block number $r$.

Table 6.3.1.4.1-1: Rate matching output sequence length $E_{U C I}$

| UCI(s) for transmission on a PUCCH | UCI for encoding | Value of $E_{\text {UCI }}$ |
| :---: | :---: | :---: |
| HARQ-ACK | HARQ-ACK | $E_{\text {UCI }}=E_{\text {tot }}$ |
| HARQ-ACK, SR | HARQ-ACK, SR | $E_{\text {UCI }}=E_{\text {tot }}$ |
| CSI <br> (CSI not of two parts) | CSI | $E_{\text {UCI }}=E_{\text {tot }}$ |
| HARQ-ACK, CSI (CSI not of two parts) | HARQ-ACK, CSI | $E_{\text {UCI }}=E_{\text {tot }}$ |
| HARQ-ACK, SR, CSI (CSI not of two parts) | $\begin{aligned} & \text { HARQ-ACK, SR, } \\ & \text { CSI } \end{aligned}$ | $E_{\text {UCI }}=E_{\text {tot }}$ |
| CSI <br> (CSI of two parts) | CSI part 1 | $E_{\mathrm{UCI}}=\min \left(E_{\text {tot }},\left[\left(O^{\text {CSI-part1 }}+L\right) / R_{\mathrm{UCI}}^{\max } / Q_{m}\right] \cdot Q_{m}\right)$ |

|  | CSI part 2 | $E_{\mathrm{UCI}}=E_{\text {tot }}-\min \left(E_{\text {tot }},\left\lceil\left(O^{\mathrm{ACK}}+O^{\mathrm{SR}}+O^{\mathrm{CSI}-\mathrm{part1}}+L\right) / R_{\mathrm{UCI}}^{\max } / Q_{m}\right\rceil \cdot Q_{m}\right)$ |

Rate matching is performed according to Clause 5.4.1 by setting $I_{B I L}=1$ and the rate matching output sequence length to $\quad E_{r}=\left|E_{\mathrm{UCI}} / C_{\mathrm{UCI}}\right|$, where $\quad C_{\mathrm{UCI}} \quad$ is the number of code blocks for UCI determined according to Clause 6.3.1.2.1 and the value of $\quad E_{\mathrm{UCI}} \quad$ is given by Table 6.3.1.4.1-1:

- $\quad O^{\text {ACK }}$ is the number of bits for HARQ-ACK for transmission on the current PUCCH;
- $O^{\mathrm{SR}}$ is the number of bits for SR for transmission on the current PUCCH;
- $\quad O^{\text {CSI-part1 }}$ is the number of bits for CSI part 1 for transmission on the current PUCCH;
- $\quad O^{\text {CSI-part2 }}$ is the number of bits for CSI part 2 for transmission on the current PUCCH;
- if $A \$ 360, L=11$; otherwise, $L$ is the number of CRC bits determined according to clause 6.3.1.2.1, where A equals $O^{\text {CSI-part1 }}$ for "CSI (CSI of two parts)", equals $O^{\text {ACK }}+O^{\text {CSI-part1 }}$ for "HARQ-ACK, CSI (CSI of two parts)", and equals $O^{\text {ACK }}+O^{\mathrm{SR}}+O^{\text {CSI-part1 }}$ for "HARQ-ACK, SR, CSI (CSI of two parts)" respectively in Table 6.3.1.4.1-1;;
- $R_{\mathrm{UCI}}^{\max }$ is the configured maximum PUCCH coding rate;
- $\quad E_{\text {tot }} \quad$ is given by Table 6.3.1.4-1.

The output bit sequence after rate matching is denoted as $f_{r 0}, f_{r 1}, f_{r 2}, \ldots, f_{r\left(E_{r}-1\right)}$ where $E_{r}$ is the length of rate matching output sequence in code block number $r$.

### 6.3.1.4.2 UCI encoded by channel coding of small block lengths

The input bit sequence to rate matching is

$$
d_{0}, d_{1}, d_{2}, \ldots, d_{N-1}
$$

The value of $\quad E_{\mathrm{UCI}} \quad$ is determined according to Table 6.3.1.4.1-1 by setting $L=0$
Rate matching is performed according to Clause 5.4 .3 by setting the rate matching output sequence length $E=E_{\mathrm{UCI}}$.
The output bit sequence after rate matching is denoted as $f_{0}, f_{1}, f_{2}, \ldots, f_{E-1}$.

### 6.3.1.5 Code block concatenation

The input bit sequence for the code block concatenation block are the sequences $f_{r 0}, f_{r 1}, f_{r 2}, \ldots, f_{r\left(E_{r}-1\right)}$, for $r=0, \ldots, C-1$ and where $E_{r}$ is the number of rate matched bits for the $r$-th code block.
Code block concatenation is performed according to Clause 5.5.
The bits after code block concatenation are denoted by $g_{0}, g_{1}, g_{2}, g_{3}, \ldots, g_{G^{\prime}-1}$, where $\quad G^{\prime}=\left[E_{\mathrm{UCI}} / C_{\mathrm{UCI}} \mid \cdot C_{\mathrm{UCI}} \quad\right.$ with the values of $\quad E_{\mathrm{UCI}} \quad$ and $C_{\mathrm{UCI}}$ given in Clause 6.3.1.4.1. Let $G$ be the total number of coded bits for transmission and $G=G^{\prime}+\bmod \left(E_{\mathrm{UCI}}, C_{\mathrm{UCI}}\right)$. Set $g_{i}=0$ for $i=G^{\prime}, G^{\prime}+1, \ldots, G-1$.

### 6.3.1.6 Multiplexing of coded UCI bits to PUCCH

If CSI of two parts are transmitted on a PUCCH, the coded bits corresponding to UCI bit sequence $a_{0}^{(1)}, a_{1}^{(1)}, a_{2}^{(1)}, a_{3}^{(1)}, \ldots, a_{A^{(1)}-1}^{(1)}$ is denoted by $g_{0}^{(1)}, g_{1}^{(1)}, g_{2}^{(1)}, g_{3}^{(1)}, \ldots, g_{G^{(1)}-1}^{(1)}$ and the coded bits corresponding to UCI bit sequence $a_{0}^{(2)}, a_{1}^{(2)}, a_{2}^{(2)}, a_{3}^{(2)}, \ldots, a_{A^{(2)}-1}^{(2)}$ is denoted by $g_{0}^{(2)}, g_{1}^{(2)}, g_{2}^{(2)}, g_{3}^{(2)}, \ldots, g_{G^{(2)}-1}^{(2)}$. The coded bit sequence $g_{0}, g_{1}, g_{2}, g_{3}, \ldots, g_{G-1}$, where $G=G^{(1)}+G^{(2)} \quad$, is generated according to the following.

Denote ${ }^{S_{l}}$ as UCI OFDM symbol index. Denote $N_{\text {UCI }}^{(i)} \quad$ as the number of elements in UCI symbol indices set $S_{\mathrm{UCI}}^{(i)}$ for $i=1, \ldots, N_{\mathrm{UCI}}^{\text {set }}$, where $S_{\mathrm{UCI}}^{(i)}$ and $N_{\mathrm{UCI}}^{\text {set }}$ are given by Table 6.3.1.6-1 according to the PUCCH
duration and the PUCCH DMRS configuration. Denote $N_{\text {symb, UCI }}^{\text {PUCCH }}=\sum_{i=1}^{N_{\text {UCI }}^{\text {set }}} N_{\text {UCI }}^{(i)}$ as the number of OFDM symbols carrying UCI in the PUCCH. Denote $Q_{m}$ as the modulation order of the PUCCH.
For PUCCH format 3, set $\quad N_{\mathrm{UCI}}^{\text {symbol }}=12 \cdot N_{\mathrm{PRB}}^{\mathrm{PUCCH}, 3} / N_{\mathrm{SF}}^{\mathrm{PUCCH}, 3}$, where $N_{\mathrm{PRB}}^{\mathrm{PUCCH}, 3}$ is the number of PRBs that is determined by the UE for PUCCH format 3 transmission according to Clause 9.2 of [5, TS 38.213], and $\quad N_{\mathrm{SF}}^{\mathrm{PUCCH}, 3}$ is the spreading factor for PUCCH format 3 [4, TS 38.211].

For PUCCH format 4, set $N_{\mathrm{UCI}}^{\text {symbol }}=12 / N_{\mathrm{SF}}^{\mathrm{PUCCH}, 4}$, where $N_{\mathrm{SF}}^{\mathrm{PUCCH}, 4}$ is the spreading factor for PUCCH format 4.

### 6.3.2 Uplink control information on PUSCH

### 6.3.2.1 UCI bit sequence generation

### 6.3.2.1.1 HARQ-ACK

If HARQ-ACK bits are transmitted on a PUSCH, the UCI bit sequence $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$ is determined as follows:

- If UCI is transmitted on PUSCH without UL-SCH and the UCI includes CSI part 1 without CSI part 2,
- if there is no HARQ-ACK bit given by Clause 9.1 of [5, TS 38.213], set $a_{0}=0, a_{1}=0$, and $A=2$;
- if there is only one HARQ-ACK bit $\stackrel{\sim}{0}_{0}^{A C K}$ given by Clause 9.1 of [5, TS 38.213], set $a_{0}=\widetilde{0}_{0}^{A C K}$,

$$
a_{1}=0 \quad, \text { and } \quad A=2
$$

- otherwise, set $a_{i}=\widetilde{o}_{i}^{A C K}$ for $i=0,1, \ldots, O^{\text {ACK }}-1$ and $A=O^{\text {ACK }}$, where the HARQ-ACK bit
sequence $\tilde{0}_{0}^{\tilde{0}_{0}^{A C K}},\left\{\tilde{0}_{1}^{A C K}, \ldots, \tilde{0}_{0^{A C K}}^{A C K}{ }_{-1}^{i}\right.$ is given by Clause 9.1 of [5, TS 38.213].

### 6.3.2.1.2 CSI

The bitwidth for PMI of codebookType=typeI-SinglePanel and codebookType=typeI-MultiPanel is specified in Clause 6.3.1.1.2.

The bitwidth for RI/LI/CQI/CRI of codebookType=typeI-SinglePanel and codebookType=typeI-MultiPanel is specified in Clause 6.3.1.1.2.

The bitwidth for PMI of codebookType=typeII is provided in Tables 6.3.2.1.2-1, where the values of $\left(N_{1}, N_{2}\right)$, $\left(O_{1}, O_{2}\right), L, N_{\text {PSK }}, M_{1}, M_{2}$, and $K^{(2)}$ are given by Clause 5.2.2.2.3 in [6, TS 38.214].

Note: the bitwidth for $\left\{i_{1,7, l}\right\}_{l=1, \ldots, v},\left\{i_{2,4, l}\right\}_{l=1, \ldots, v}$ and $\left\{i_{2,5, l}\right\}_{l=1, \ldots, v}$ shown in Table 6.3.2.1.2-2A is the total bitwidth of $\left\{i_{1,7, l}\right\},\left\{i_{2,4, l}\right\}$ and $\left\{i_{2,5, l}\right\} \quad$ up to Rank $=v$, respectively, and the corresponding per layer bitwidths are $2 L M_{0}, 3\left(K_{l}^{N Z}-1\right)$, and $4\left(K_{l}^{N Z}-1\right)$, (i.e., 1,3 , and 4 bits for each respective indicator elements $k_{l, i, f}^{(3)}, k_{l, i, f}^{(2)}$, and $c_{l, i, f}$, respectively), where $K_{l}^{N Z} \quad$ as defined in Clause 5.2.2.2.5 in [6, TS 38.214] is the number of nonzero coefficients for layer $l$ such that $K^{N Z}=\sum_{l=1}^{0} K_{l}^{N Z}$.

For CSI on PUSCH, two UCI bit sequences are generated,

$$
a_{0}^{(1)}, a_{1}^{(1)}, a_{2}^{(1)}, a_{3}^{(1)}, \ldots, a_{A^{(1)}-1}^{(1)} \text { and }
$$

$a_{0}^{(2)}, a_{1}^{(2)}, a_{2}^{(2)}, a_{3}^{(2)}, \ldots, a_{\left.A^{2}\right)-1}^{(2)}$. The CSI fields of all CSI reports, in the order from upper part to lower part in Table
6.3.2.1.2-6, are mapped to the UCI bit sequence $a_{0}^{(1)}, a_{1}^{(1)}, a_{2}^{(1)}, a_{3}^{(1)}, \ldots, a_{\left.A^{(1)}\right)-1}$ starting with $a_{0}^{(1)}$. The CSI fields of all CSI reports, in the order from upper part to lower part in Table 6.3.2.1.2-7, are mapped to the UCI bit sequence $a_{0}^{(2)}, a_{1}^{(2)}, a_{2}^{(2)}, a_{3}^{(2)}, \ldots, a_{A^{(2)}-1}^{(2)}$ starting with $a_{0}^{(2)}$.

The mapping order of CSI fields of one report for CRI/RSRP or SSBRI/RSRP reporting is provided in Table 6.3.1.1.2-8. The mapping order of CSI fields of one report for CRI/SINR or SSBRI/SINR reporting is provided in Table 6.3.1.1.28A. The procedure in clause 6.3.2 described for CSI part 1 is also applicable for one report for CRI/RSRP, SSBRI/RSRP, CRI/SINR, or SSBRI/SINR reporting.

Table 6.3.2.1.2-3: Mapping order of CSI fields of one CSI report, CSI part 1

| CSI report number | CSI fields |
| :---: | :---: |
| CSI report \#n CSI part 1 | CRI as in Tables 6.3.1.1.2-3/4/6, if reported |
|  | Rank Indicator as in Tables 6.3.1.1.2-3/4/5 or 6.3.2.1.2-8, if reported |
|  | Wideband CQI for the first TB as in Tables 6.3.1.1.2-3/4/5 or 6.3.2.1.2-8, if reported |
|  | Subband differential CQI for the first TB with increasing order of subband number as in Tables $6.3 .1 .1 .2-3 / 4 / 5$ or 6.3.2.1.2-8, if reported |
|  | Indicator of the number of non-zero wideband amplitude coefficients $M_{0}$ for layer 0 as in Table 6.3.1.1.2-5, if reported |
|  | Indicator of the number of non-zero wideband amplitude coefficients $M_{1}$ for layer 1 as in Table 6.3.1.1.2-5 (if the rank according to the reported RI is equal to one, this field is set to all zeros), if 2-layer PMI reporting is allowed according to the rank restriction in Clauses 5.2.2.2.3 and 5.2.2.2.4 [6, TS 38.214] and if reported |
|  | Indicator of the total number of non-zero coefficients summed across all layers $K^{N Z}$ as in Table 6.3.2.1.2-8, if reported |
| Note: $\begin{aligned} & \text { Subbands } \\ & \text { continuous }\end{aligned}$ | given CSI report $n$ indicated by the higher layer parameter csi-ReportingBand are numbered the increasing order with the lowest subband of csi-ReportingBand as subband 0. |

Table 6.3.2.1.2-4: Mapping order of CSI fields of one CSI report, CSI part 2 wideband

| CSI report number | CSI fields |
| :---: | :---: |
| CSI report \#n CSI part 2 wideband | Wideband CQI for the second TB as in Tables 6.3.1.1.2-3/4/5, if present and reported |
|  | Layer Indicator as in Tables 6.3.1.1.2-3/4/5, if reported |
|  | PMI wideband information fields $X_{1}$, from left to right as in Tables 6.3.1.1.2-1/2 or 6.3.2.1.2-1/2, if reported |
|  | PMI wideband information fields $X_{2}$, from left to right as in Tables 6.3.1.1.2-1/2 or 6.3.2.1.2-1/2, or codebook index for 2 antenna ports according to Clause 5.2.2.2.1 in [6, TS38.214], if pmi-FormatIndicator= widebandPMI and if reported |

Table 6.3.2.1.2-5: Mapping order of CSI fields of one CSI report, CSI part 2 subband

| CSI report \#n Part 2 subband | Subband differential CQI for the second TB of all even subbands with increasing order of subband number, as in Tables 6.3.1.1.2-3/4/5, if cqi-Format/ndicator=subbandCQI and if reported |
| :---: | :---: |
|  | PMI subband information fields $X_{2}$ of all even subbands with increasing order of subband number, from left to right as in Tables 6.3.1.1.2-1/2 or 6.3.2.1.2-1/2, or codebook index for 2 antenna ports according to Clause 5.2.2.2.1 in [6, TS38.214] of all even subbands with increasing order of subband number, if pmi-FormatIndicator= subbandPMI and if reported |
|  | Subband differential CQI for the second TB of all odd subbands with increasing order of subband number, as in Tables 6.3.1.1.2-3/4/5, if cqi-Format/ndicator=subbandCQI and if reported |
|  | PMI subband information fields $X_{2}$ of all odd subbands with increasing order of subband number, from left to right as in Tables 6.3.1.1.2-1/2 or 6.3.2.1.2-1/2, or codebook index for 2 antenna ports according to Clause 5.2.2.2.1 in [6, TS38.214] of all odd subbands with increasing order of subband number, if pmi-FormatIndicator= subbandPMI and if reported |
| Note: | ds for given CSI report $n$ indicated by the higher layer parameter csi-ReportingBand are numbere ously in the increasing order with the lowest subband of csi-ReportingBand as subband 0 . |

Table 6.3.2.1.2-5A: Mapping order of CSI fields of one CSI report, CSI part 2 of codebookType=typellr16 or typell-PortSelection-r16

| CSI report <br> number | CSI fields |
| :---: | :---: | :---: |
| CSI report \#n <br> CSI part 2, group <br> 0 | PMI fields $\quad X_{1} \quad$, from left to right as in Tables 6.3.2.1.2-1A/2A, if reported |

Table 6.3.2.1.2-6: Mapping order of CSI reports to UCI bit sequence $a_{0}^{(1)}, a_{1}^{(1)}, a_{2}^{(1)}, a_{3}^{(1)}, \ldots, a_{A^{(1)}-1}^{(1)}$,
with two-part CSI report(s)

| UCI bit sequence | CSI report number |
| :---: | :---: |
|  | CSI part 1 of CSI report \#1 as in Table 6.3.2.1.2-3 or Table |
| $a_{1}^{(1)}$ | 6.3.1.1.2-8 or Table 6.3.1.1.2-8A |
| $a_{2}^{(1)}$ | CSI part 1 of CSI report \#2 as in Table 6.3.2.1.2-3 or Table |
| $a_{3}^{(1)}$ | $6.3 .1 .1 .2-8$ or Table 6.3.1.1.2-8A |
|  | $\ldots$ |
| $a_{A^{(1)}-1}^{(1)}$ | CSI part 1 of CSI report \#n as in Table 6.3.2.1.2-3 or Table |
| 6.3.1.1.2-8 or Table 6.3.1.1.2-8A |  |

where CSI report \#1, CSI report \#2, ..., CSI report \#n in Table 6.3.2.1.2-6 correspond to the CSI reports in increasing order of CSI report priority values according to Clause 5.2 .5 of [6, TS38.214].

Table 6.3.2.1.2-7: Mapping order of CSI reports to UCI bit sequence $a_{0}^{(2)}, a_{1}^{(2)}, a_{2}^{(2)}, a_{3}^{(2)}, \ldots, a_{A^{(2)}-1}^{(2)}$, with two-part CSI report(s)

| UCI bit sequence | CSI report number |
| :---: | :---: |
| $\begin{gathered} a_{0}^{(2)} \\ a_{1}^{(2)} \\ a_{2}^{(2)} \\ a_{3}^{(2)} \\ \vdots \\ a_{A^{(2)}-1}^{2} \end{gathered}$ | CSI report \#1, CSI part 2 wideband, as in Table 6.3.2.1.2-4, or CSI part 2 with group 0, as in Table 6.3.2.1.2-5A, if CSI part 2 exists for CSI report \#1 |
|  | CSI report \#2, CSI part 2 wideband, as in Table 6.3.2.1.2-4, or CSI part 2 with group 0, as in Table 6.3.2.1.2-5A, if CSI part 2 exists for CSI report \#2 |
|  |  |
|  | CSI report \#n, CSI part 2 wideband, as in Table 6.3.2.1.2-4, or CSI part 2 with group 0, as in Table 6.3.2.1.2-5A, if CSI part 2 exists for CSI report \#n |
|  | CSI report \#1, CSI part 2 subband, as in Table 6.3.2.1.2-5, or CSI part 2 with group 1 and 2, as in Table 6.3.2.1.2-5A, if CSI part 2 exists for CSI report \#1 |
|  | CSI report \#2, CSI part 2 subband, as in Table 6.3.2.1.2-5, or CSI part 2 with group 1 and 2, as in Table 6.3.2.1.2-5A, if CSI part 2 exists for CSI report \#2 |
|  | $\ldots$ |
|  | CSI report \#n, CSI part 2 subband, as in Table 6.3.2.1.2-5, or CSI part 2 with group 1 and 2, as in Table 6.3.2.1.2-5A, if CSI part 2 exists for CSI report \#n |

where CSI report \#1, CSI report \#2, ..., CSI report \#n in Table 6.3.2.1.2-7 correspond to the CSI reports in increasing order of CSI report priority values according to Clause 5.2 .5 of [6, TS38.214].

The bitwidth for RI/CQI of codebookType = typeII-r16 or codebookType=typeII-PortSelection-r16 is provided in Table 6.3.2.1.2-8.

Table 6.3.2.1.2-8: RI and CQI of codebookType=typell-r16 or typell-PortSelection-r16

| Field | Bitwidth |
| :---: | :---: |
| Rank Indicator | $\min \left(2,\left\lceil\log _{2} n_{R I}\right\rceil\right)$ |
| Wide-band CQI | 4 |
| Subband differential CQI | 2 |
| Indicator of the total number of non-zero coefficients <br> summed across all layers $K^{N Z}$ | $\left.\Gamma \log _{2}\left(K_{0}\right)\right\rceil$ if max <br> allowed rank is 1; <br> $\left.\Gamma \log _{2}\left(2 K_{0}\right)\right\rceil$ <br> otherwise |

where $\quad n_{R I}$ is the number of allowed rank indicator values according to Clauses 5.2.2.2.5 and 5.2.2.2.6 [6, TS
38.214], $\quad K_{0}=\left\lceil 2 L\left\lceil p_{1} \times \frac{N_{3}}{R}\right\rceil \beta\right\rceil$, where $\quad p_{1}, \quad N_{3}, \quad R$, and $\quad \beta$ are given by Clause 5.2.2.2.5 and 5.2.2.2.6 in [6, TS 38.214]. The values of the rank indicator field are mapped to allowed rank indicator values with increasing order, where ' 0 ' is mapped to the smallest allowed rank indicator value.

### 6.3.2.1.3

CG-UCI
For CG-UCI bits transmitted on a CG PUSCH, the CG-UCI bit sequence $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$ is determined as follows:

- set $a_{i}=\tilde{o}_{i}^{C G-U C I}$ for $i=0,1, \ldots, O^{C G-U C I}-1$ and $A=O^{C G-U C I}$, where the CG-UCI bit sequence $\tilde{o}_{0}^{C G-U C I}, \tilde{o}_{1}^{C G-U C I}, \ldots, \tilde{o}_{O^{C G-U C I}-1}^{C G-U C I}$ is given by Table 6.3.2.1.3-1, mapped in the order from upper part to lower part.

Table 6.3.2.1.3-1: Mapping order of CG-UCI fields

| Field | Bitwidth |
| :---: | :---: |
| HARQ process number | 4 |
| Redundancy version | 2 |
| New data indicator | 1 |
| Channel Occupancy Time (COT) sharing information | $\left\lceil\log _{2} C\right\rceil$ if both higher layer parameter ul-toDL-COT- <br> SharingED-Threshold and higher layer parameter cg-COT- <br> SharingList are configured, where $C$ is the number of combinations configured in cg-COT-SharingList; <br> 1 if higher layer parameter ul-toDL-COT-SharingED-Threshold is not configured and higher layer parameter cg -COT-SharingOffset is configured; <br> 0 otherwise; <br> If a UE indicates COT sharing other than "no sharing" in a CG PUSCH within the UE's initiated COT, the UE should provide consistent COT sharing information in all the subsequent CG PUSCHs, if any, occurring within the same UE's initiated COT such that the same DL starting point and duration are maintained. |

### 6.3.2.1.4 HARQ-ACK and CG-UCI

When higher layer parameter cg-UCI-Multiplexing is configured, the UCI bit sequence $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$ is determined as follows, where $A=O^{C G-U C I}+O^{A C K}$.

- The CG-UCI bits are mapped to the UCI bit sequence $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{O^{\text {CG-UCI }}-1}$, where $a_{i}=\tilde{o}_{i}^{C G-U C I}$ for $i=0,1, \ldots, O^{C G-U C I}-1$. The CG-UCI bit sequence $\tilde{o}_{0}^{C G-U C I}, \tilde{o}_{1}^{C G-U C I}, \ldots, \tilde{o}_{O^{C G-U C I}-1}^{C G-U C I}$ is given by Table 6.3.2.1.3-1 mapped in the order from upper part to lower part, and $O^{C G-U C I}$ is number of CG-UCI bits;
- The HARQ-ACK bits are mapped to the UCI bit sequence $a_{O^{C G-U C I}}, a_{O^{C G-U C I}+1}, \ldots, a_{O^{C G-U C I}+O^{A C K}-1}$, where $a_{i+O^{C G-U C I}}=\widetilde{o}_{i}^{A C K}$ for $i=0,1, \ldots, O^{A C K}-1$. The HARQ-ACK bit sequence $\tilde{o}_{0}^{A C K}, \widetilde{o}_{1}^{A C K}, \ldots, \widetilde{o}_{O^{A C K}-1}^{A C K}$ is given by Clause 9.1 of [5, TS38.213], and $O^{A C K}$ is number of HARQ-ACK bits.

### 6.3.2.2 Code block segmentation and CRC attachment

Denote the bits of the payload by $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$, where $A$ is the payload size. The procedure in 6.3.2.2.1 applies for $A \geq 12$ and the procedure in Clause 6.3.2.2.2 applies for $A \leq 11$.

### 6.3.2.2.1 UCI encoded by Polar code

Code block segmentation and CRC attachment is performed according to Clause 6.3.1.2.1.

### 6.3.2.2.2 UCI encoded by channel coding of small block lengths

The procedure in Clause 6.3.1.2.2 applies.

### 6.3.2.3 Channel coding of UCI

### 6.3.2.3.1 UCI encoded by Polar code

Channel coding is performed according to Clause 6.3.1.3.1, except that the rate matching output sequence length $\quad E_{r}$ is given in Clause 6.3.2.4.1.

### 6.3.2.3.2 UCI encoded by channel coding of small block lengths

Information bits are delivered to the channel coding block. They are denoted by $c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{K-1}$, where $K$ is the number of bits.

The information bits are encoded according to Clause 5.3.3.
After encoding the bits are denoted by $d_{0}, d_{1}, d_{2}, d_{3}, \ldots, d_{N-1}$, where $N$ is the number of coded bits.

### 6.3.2.4 Rate matching

### 6.3.2.4.1 UCI encoded by Polar code

### 6.3.2.4.1.1HARQ-ACK

For HARQ-ACK transmission on PUSCH not using repetition type B with UL-SCH, the number of coded modulation symbols per layer for HARQ-ACK transmission, denoted as $Q_{A C K}^{\prime}$, is determined as follows:

$$
Q_{\mathrm{ACK}}^{\prime}=\min \left\{\left[\frac{\left(O_{\mathrm{ACK}}+L_{\mathrm{ACK}}\right) \cdot \beta_{\mathrm{offset}}^{\mathrm{PUSCH}} \cdot \sum_{l=0}^{N_{\mathrm{symb}, \mathrm{all}}^{\mathrm{PUSH}}-1} M_{\mathrm{sc}}^{\mathrm{UCI}}(l)}{\sum_{r=0}^{C_{\mathrm{UL}-\mathrm{SCH}}-1} K_{r}}\right\rceil,\left\lceil\alpha \cdot \sum_{l=l_{0}}^{N_{\mathrm{symb}, \mathrm{all}}-1} M_{\mathrm{sc}}^{\mathrm{PUSC}}(l)\right\rangle\right\}
$$

where

- $0_{\text {ACK }}$ is the number of HARQ-ACK bits;
- if $O_{\text {ACK }} 360, L_{\text {ACK }}=11$; otherwise $L_{\text {ACK }}$ is the number of CRC bits for HARQ-ACK determined according to Clause 6.3.1.2.1;
$-\quad \beta_{\text {offset }}^{\mathrm{PUSCH}}=\beta_{\text {offset }}^{\mathrm{HARQ}-\mathrm{ACK}}$;
- $C_{\mathrm{UL}-\mathrm{SCH}}$ is the number of code blocks for UL-SCH of the PUSCH transmission;
- if the DCI format scheduling the PUSCH transmission includes a CBGTI field indicating that the UE shall not transmit the $r$-th code block, $K_{r}=0$; otherwise, $K_{r}$ is the $r$-th code block size for UL-SCH of the PUSCH transmission;
- $\quad M_{\mathrm{sc}}^{\mathrm{PUSCH}} \quad$ is the scheduled bandwidth of the PUSCH transmission, expressed as a number of subcarriers;
- $M_{\mathrm{sc}}^{\mathrm{PT}-\mathrm{RS}}(l)$ is the number of subcarriers in OFDM symbol $\quad l$ that carries PTRS, in the PUSCH transmission;
- $\quad M_{\mathrm{sc}}^{\mathrm{UCI}}(l)$ is the number of resource elements that can be used for transmission of UCI in OFDM symbol $l$, for $l=0,1,2, \ldots, N_{\text {symb,all }}^{\text {PUSCH }}-1$, in the PUSCH transmission and $N_{\text {symb,all }}^{\text {PUSCH }}$ is the total number of OFDM symbols of the PUSCH, including all OFDM symbols used for DMRS;
- for any OFDM symbol that carries DMRS of the PUSCH, ${ }^{M_{\mathrm{sc}}^{\mathrm{UCI}}}(l)=0$;
- for any OFDM symbol that does not carry DMRS of the PUSCH, $M_{\mathrm{sc}}^{\mathrm{UCI}}(l)=M_{\mathrm{sc}}^{\mathrm{PUSCH}}-M_{\mathrm{sc}}^{\mathrm{PT}-\mathrm{RS}}(l)$;
- $\quad \alpha$ is configured by higher layer parameter scaling;
- $\quad l_{0}$ is the symbol index of the first OFDM symbol that does not carry DMRS of the PUSCH, after the first DMRS symbol(s), in the PUSCH transmission.

For HARQ-ACK transmission on an actual repetition of a PUSCH with repetition Type B with UL-SCH, the number of coded modulation symbols per layer for HARQ-ACK transmission, denoted as $Q_{A C K}^{\prime}$, is determined as follows:
where

- $\quad M_{\text {sc,nominal }}^{\mathrm{UCI}}(l)$ is the number of resource elements that can be used for transmission of UCI in OFDM symbol $l$, for $l=0,1,2, \cdots, N_{\text {symb,nominal }}^{\text {PUSCH }}-1$, in the PUSCH transmission assuming a nominal repetition without segmentation, and $\quad N_{\text {symb,nominal }}^{\text {PUSCH }} \quad$ is the total number of OFDM symbols in a nominal repetition of the PUSCH, including all OFDM symbols used for DMRS;
- for any OFDM symbol that carries DMRS of the PUSCH assuming a nominal repetition without segmentation, $\quad M_{\mathrm{sc}, \text { nominal }}^{\mathrm{UCI}}(l)=0 \quad ;$
- for any OFDM symbol that does not carry DMRS of the PUSCH assuming a nominal repetition without segmentation, $\quad M_{\mathrm{sc}, \text { nominal }}^{\mathrm{UCI}}(l)=M_{\mathrm{sc}}^{\mathrm{PUSCH}}-M_{\mathrm{sc}, \text { nominal }}^{\mathrm{PT}-\text { SS }}(l) \quad$ where $\quad M_{\mathrm{sc}, \text { nominal }}^{\mathrm{PT} \text { RS }}(l) \quad$ is the number of subcarriers in OFDM symbol $l$ that carries PTRS, in the PUSCH transmission assuming a nominal repetition without segmentation;
- $\quad M_{\text {sc,actual }}^{\text {UCI }}(l)$ is the number of resource elements that can be used for transmission of UCI in OFDM symbol $l$, for $l=0,1,2, \cdots, N_{\text {symb,actual }}^{\text {PUSCH }}-1$, in the actual repetition of the PUSCH transmission, and $N_{\text {symb,actual }}^{\text {PUSCH }}$ is the total number of OFDM symbols in the actual repetition of the PUSCH transmission, including all OFDM symbols used for DMRS;
- for any OFDM symbol that carries DMRS of the actual repetition of the PUSCH transmission, $M_{\mathrm{sc}, \text { actual }}^{\mathrm{UCI}}(I)=0$;
- for any OFDM symbol that does not carry DMRS of the actual repetition of the PUSCH transmission, $M_{\mathrm{sc}, \text { actual }}^{\mathrm{UCI}}(l)=M_{\mathrm{sc}}^{\mathrm{PUSCH}}-M_{\mathrm{sc}, \text { actual }}^{\text {PT-RS }}(l) \quad$ where $\quad M_{\mathrm{sc}, \text { actual }}^{\text {PT-RS }}(l)$ is the number of subcarriers in OFDM symbol $l$ that carries PTRS, in the actual repetition of the PUSCH transmission;
- and all the other notations in the formula are defined the same as for PUSCH not using repetition type B.

For HARQ-ACK transmission on PUSCH without UL-SCH, the number of coded modulation symbols per layer for HARQ-ACK transmission, denoted as $Q_{\text {ACK }}^{\prime}$, is determined as follows:

where

- $O_{\text {ACK }}$ is the number of HARQ-ACK bits;
- if $O_{\text {ACK }}$ ? $360, L_{\text {ACK }}=11$; otherwise $L_{\text {ACK }}$ is the number of CRC bits for HARQ-ACK defined according to Clause 6.3.1.2.1;;
$-\quad \beta_{\text {offset }}^{\text {PUSCH }}=\beta_{\text {offset }}^{\text {HARQ-ACK }} ;$
- $\quad M_{\mathrm{sc}}^{\mathrm{PUSCH}} \quad$ is the scheduled bandwidth of the PUSCH transmission, expressed as a number of subcarriers;
- $M_{\mathrm{sc}}^{\mathrm{PT}-\mathrm{RS}}(l)$ is the number of subcarriers in OFDM symbol $l$ that carries PTRS, in the PUSCH transmission;
- $\quad M_{\mathrm{sc}}^{\mathrm{UCI}}(l)$ is the number of resource elements that can be used for transmission of UCI in OFDM symbol $l$, for $l=0,1,2, \ldots, N_{\text {symb,all }}^{\text {PUSCH }}-1$, in the PUSCH transmission and $N_{\text {symb,all }}^{\text {PUSCH }}$ is the total number of OFDM symbols of the PUSCH, including all OFDM symbols used for DMRS;
- for any OFDM symbol that carries DMRS of the PUSCH, ${ }^{M_{\mathrm{sc}}^{\mathrm{UCI}}}(l)=0$;
- for any OFDM symbol that does not carry DMRS of the PUSCH, $M_{\mathrm{sc}}^{\mathrm{UCI}}(l)=M_{\mathrm{sc}}^{\mathrm{PUSCH}}-M_{\mathrm{sc}}^{\mathrm{PT}-\mathrm{RS}}(l)$;
- $I_{0}$ is the symbol index of the first OFDM symbol that does not carry DMRS of the PUSCH, after the first DMRS symbol(s), in the PUSCH transmission;
- $\quad R$ is the code rate of the PUSCH, determined according to Clause 6.1.4.1 of [6, TS38.214];
- $Q_{m}$ is the modulation order of the PUSCH;
- $\quad \alpha$ is configured by higher layer parameter scaling.

The input bit sequence to rate matching is $d_{r 0}, d_{r 1}, d_{r 2}, d_{r 3}, \ldots, d_{r\left(N_{r}-1\right)}$ where $r$ is the code block number, and $N_{r}$ is the number of coded bits in code block number $r$.

Rate matching is performed according to Clause 5.4 .1 by setting $\quad I_{B I L}=1$ and the rate matching output sequence length to $E_{r}=\left\lfloor E_{\mathrm{UCI}} / C_{\mathrm{UCI}}\right\rfloor$, where

- $\quad C_{\mathrm{UCI}}$ is the number of code blocks for UCI determined according to Clause 5.2.1;
- $\quad N_{L} \quad$ is the number of transmission layers of the PUSCH;
- $Q_{m}$ is the modulation order of the PUSCH;
- $E_{\mathrm{UCI}}=N_{L} \cdot Q^{\prime}{ }_{\mathrm{ACK}} \cdot Q_{m}$.

The output bit sequence after rate matching is denoted as $f_{r 0}, f_{r 1}, f_{r 2}, \ldots, f_{r\left(E_{r}-1\right)}$ where $E_{r}$ is the length of rate matching output sequence in code block number $r$.

### 6.3.2.4.1.2CSI part 1

For CSI part 1 transmission on PUSCH not using repetition type B with UL-SCH, the number of coded modulation symbols per layer for CSI part 1 transmission, denoted as $Q_{\text {CSI-part1 }}$, is determined as follows:
where

- $O_{\text {CSI-1 }}$ is the number of bits for CSI part 1;
- if $O_{\text {CSI-1 }} 360, L_{\text {CSI-1 }}=11$; otherwise ${ }^{L_{\text {CSI-1 }}}$ is the number of CRC bits for CSI part 1 determined according to Clause 6.3.1.2.1;
$-\quad \beta_{\text {offset }}^{\text {PUSCH }}=\beta_{\text {offset }}^{\text {CSI-part1 }}$;
- $C_{\mathrm{UL}-\mathrm{SCH}}$ is the number of code blocks for UL-SCH of the PUSCH transmission;
- if the DCI format scheduling the PUSCH transmission includes a CBGTI field indicating that the UE shall not transmit the $\quad r$-th code block, $K_{r}=0$; otherwise, $K_{r}$ is the $r$-th code block size for UL-SCH of the PUSCH transmission;
- $\quad M_{\mathrm{sc}}^{\mathrm{PUSCH}}$ is the scheduled bandwidth of the PUSCH transmission, expressed as a number of subcarriers;
- $M_{\mathrm{sc}}^{\mathrm{PT}-\mathrm{RS}}(l)$ is the number of subcarriers in OFDM symbol $l$ that carries PTRS, in the PUSCH transmission;
- $\quad Q_{A C K / C G-U C I}^{\prime}=Q_{A C K}^{\prime} \quad$ if HARQ-ACK is present for transmission on the same PUSCH with UL-SCH and without CG-UCI, where $\quad Q_{A C K}^{\prime} \quad$ is the number of coded modulation symbols per layer for HARQ-ACK transmitted on the PUSCH as defined in clause 6.3.2.4.1.1 if number of HARQ-ACK information bits is more

$$
Q_{\mathrm{ACK}}^{\prime}=\prod_{l=0}^{\substack{N_{\mathrm{symg}}^{\mathrm{pulh}}-1}} \bar{M}_{\mathrm{sc}, \mathrm{rvd}}^{\mathrm{ACK}}(l)
$$ if the number of HARQ-ACK information bits is no more than 2 bits, than 2, and where $\bar{M}_{\text {sc, rvd }}^{\text {ACK }}(l)$ is the number of reserved resource elements for potential HARQ-ACK transmission in OFDM symbol $l$, for $l=0,1,2, \ldots, N_{\text {symb,all }}^{\text {PUSCH }}-1$, in the PUSCH transmission, defined in Clause 6.2.7; or

- $Q_{A C K / C G-U C I}^{\prime}=Q_{A C K}^{\prime}$ if both HARQ-ACK and CG-UCI are present on the same PUSCH with UL-SCH, where $Q_{A C K}^{\prime}$ is the number of coded modulation symbols per layer for HARQ-ACK and CG-UCI transmitted on the PUSCH as defined in clause 6.3.2.4.1.5; or
- $Q_{A C K / C G-U C I}^{\prime}=Q_{C G-U C I}^{\prime} \quad$ if CG-UCI is present on the same PUSCH with UL-SCH and without HARQACK, where $Q_{C G-U C I}^{\prime}$ is the number of coded modulation symbols per layer for CG-UCI transmitted on the PUSCH as defined in clause 6.3.2.4.1.4;
- $\quad M_{\text {sc }}^{\mathrm{UCI}}(l)$ is the number of resource elements that can be used for transmission of UCI in OFDM symbol $l$, for $l=0,1,2, \ldots, N_{\text {symb,all }}^{\text {PUSCH }}-1$, in the PUSCH transmission and $N_{\text {symb,all }}^{\text {PUSCH }}$ is the total number of OFDM symbols of the PUSCH, including all OFDM symbols used for DMRS;
- for any OFDM symbol that carries DMRS of the PUSCH, ${ }^{M_{\mathrm{sc}}^{\mathrm{UCI}}}(l)=0$;
- for any OFDM symbol that does not carry DMRS of the PUSCH, $M_{\mathrm{sc}}^{\mathrm{UCI}}(l)=M_{\mathrm{sc}}^{\mathrm{PUSCH}}-M_{\mathrm{sc}}^{\mathrm{PT}-\mathrm{RS}}(l)$;
- $\quad \alpha$ is configured by higher layer parameter scaling.

For CSI part 1 transmission on an actual repetition of a PUSCH with repetition Type B with UL-SCH, the number of coded modulation symbols per layer for CSI part 1 transmission, denoted as $Q_{\text {CSI-part } 1}^{\prime}$, is determined as follows:
where

- $\quad M_{\mathrm{sc}, \text { nominal }}^{\mathrm{UCI}}(l) \quad$ is the number of resource elements that can be used for transmission of UCI in OFDM symbol $l$, for $l=0,1,2, \cdots, N_{\text {symb,nominal }}^{\text {PUSC }}-1$, in the PUSCH transmission assuming a nominal repetition without segmentation, and $\quad N_{\text {symb,nominal }}^{\mathrm{PUSCH}} \quad$ is the total number of OFDM symbols in a nominal repetition of the PUSCH, including all OFDM symbols used for DMRS;
- for any OFDM symbol that carries DMRS of the PUSCH assuming a nominal repetition without segmentation, $\quad M_{\mathrm{sc}, \text { nominal }}^{\mathrm{UCI}}(l)=0 \quad ;$
- for any OFDM symbol that does not carry DMRS of the PUSCH assuming a nominal repetition without segmentation, $\quad M_{\mathrm{sc}, \text { nominal }}^{\mathrm{UCI}}(l)=M_{\mathrm{sc}}^{\mathrm{PUSCH}}-M_{\mathrm{sc}, \text { nominal }}^{\mathrm{PT}-\text { SS }}(l) \quad$ where $\quad M_{\mathrm{sc}, \text { nominal }}^{\mathrm{PT} \text { RS }}(l) \quad$ is the number of subcarriers in OFDM symbol $l$ that carries PTRS, in the PUSCH transmission assuming a nominal repetition without segmentation;
- $\quad M_{\mathrm{sc}, \text { actual }}^{\mathrm{UCI}}(l)$ is the number of resource elements that can be used for transmission of UCI in OFDM symbol $l$, for $l=0,1,2, \cdots, N_{\text {symb,actual }}^{\text {PUSC }}-1$, in the actual repetition of the PUSCH transmission, and $N_{\text {symb,actual }}^{\text {PUSCH }}$ is the total number of OFDM symbols in the actual repetition of the PUSCH transmission, including all OFDM symbols used for DMRS;
- for any OFDM symbol that carries DMRS of the actual repetition of the PUSCH transmission,

$$
M_{\mathrm{sc}, \mathrm{actual}}^{\mathrm{UCl}}(I)=0
$$

- for any OFDM symbol that does not carry DMRS of the actual repetition of the PUSCH transmission, $M_{\mathrm{sc}, \text { actual }}^{\mathrm{UCI}}(l)=M_{\mathrm{sc}}^{\mathrm{PUSCH}}-M_{\mathrm{sc}, \text { actual }}^{\mathrm{PT}-\mathrm{RS}}(l) \quad$ where $\quad M_{\mathrm{sc}, \text { actual }}^{\mathrm{PTTRS}}(l) \quad$ is the number of subcarriers in OFDM symbol $l$ that carries PTRS, in the actual repetition of the PUSCH transmission;
- and all the other notations in the formula are defined the same as for PUSCH not using repetition type B.

For CSI part 1 transmission on PUSCH without UL-SCH, the number of coded modulation symbols per layer for CSI part 1 transmission, denoted as $Q_{\text {CSI-part1 }}^{\prime}$, is determined as follows:
if there is CSI part 2 to be transmitted on the PUSCH,
else
end if
where
$O_{\text {CSI-1 }}$ is the number of bits for CSI part 1;

- if $O_{\mathrm{CSI}-1}$, $L_{\mathrm{CSI}-1}=11$; otherwise ${ }^{L_{\mathrm{CSI}-1}}$ is the number of CRC bits for CSI part 1 determined according to Clause 6.3.1.2.1;
$-\quad \beta_{\text {offset }}^{\mathrm{PUSCH}}=\beta_{\text {offset }}^{\mathrm{CSI}-p a r t 1}$;
- $\quad M_{\mathrm{sc}}^{\mathrm{PUSCH}} \quad$ is the scheduled bandwidth of the PUSCH transmission, expressed as a number of subcarriers;
- $M_{\mathrm{sc}}^{\mathrm{PT}-\mathrm{RS}}(l)$ is the number of subcarriers in OFDM symbol $l$ that carries PTRS, in the PUSCH transmission;
- $Q^{\prime}$ ACK is the number of coded modulation symbols per layer for HARQ-ACK transmitted on the PUSCH if

$$
Q_{\mathrm{ACK}}^{\prime}=\varlimsup_{l=0}^{\substack{\mathrm{syym} \\ \text { PUCH }}} \bar{M}_{\mathrm{sC}, \text { rvd }}^{\mathrm{ACK}}(l) \quad \text { if the number of }
$$ number of HARQ-ACK information bits is more than 2, and

$$
\bar{M}_{\mathrm{sc}, \mathrm{rvd}}^{\mathrm{ACK}}(l)
$$ HARQ-ACK information bits is no more than 2 bits, where $\bar{M}_{\text {sc, rvd }}^{\text {ACK }}(l)$ is the number of reserved resource

elements for potential HARQ-ACK transmission in OFDM symbol $l$, for $l=0,1,2, \ldots, N_{\text {symb,all }}^{\text {PUSC }}-1$, in the PUSCH transmission, defined in Clause 6.2.7;

- $\quad M_{\mathrm{sc}}^{\mathrm{UCI}}(l)$ is the number of resource elements that can be used for transmission of UCI in OFDM symbol $l$, for $l=0,1,2, \ldots, N_{\text {symb,all }}^{\text {PUSCH }}-1$, in the PUSCH transmission and $N_{\text {symb,all }}^{\text {PUSCH }}$ is the total number of OFDM symbols of the PUSCH, including all OFDM symbols used for DMRS;
- for any OFDM symbol that carries DMRS of the PUSCH, ${ }^{M_{\mathrm{sc}}^{\mathrm{UCI}}}(l)=0$;
- for any OFDM symbol that does not carry DMRS of the PUSCH, $M_{\mathrm{sc}}^{\mathrm{UCI}}(l)=M_{\mathrm{sc}}^{\mathrm{PUSCH}}-M_{\mathrm{sc}}^{\mathrm{PT}-\mathrm{RS}}(l)$;
- $\quad R$ is the code rate of the PUSCH, determined according to Clause 6.1.4.1 of [6, TS38.214];
- $\quad Q_{m}$ is the modulation order of the PUSCH.

The input bit sequence to rate matching is

$$
d_{r 0}, d_{r 1}, d_{r 2}, d_{r 3}, \ldots, d_{r\left(N_{r}-1\right)}
$$

where $\quad r$ is the code block number, and $N_{r}$ is the number of coded bits in code block number $r$.

Rate matching is performed according to Clause 5.4 .1 by setting $I_{B I L}=1$ and the rate matching output sequence length to $E_{r}=\left\lfloor E_{\mathrm{UCI}} / C_{\mathrm{UCI}}\right\rfloor$, where

- $\quad C_{\mathrm{UCI}}$ is the number of code blocks for UCI determined according to Clause 5.2.1;
- $\quad N_{L} \quad$ is the number of transmission layers of the PUSCH;
- $Q_{m}$ is the modulation order of the PUSCH;
- $E_{\mathrm{UCI}}=N_{L} \cdot Q^{\prime}{ }_{\mathrm{CSI}, 1} \cdot Q_{m}$.

The output bit sequence after rate matching is denoted as $f_{r 0}, f_{r 1}, f_{r 2}, \ldots, f_{r\left(E_{r}-1\right)}$ where $E_{r}$ is the length of rate matching output sequence in code block number $r$.

### 6.3.2.4.1.3CSI part 2

For CSI part 2 transmission on PUSCH not using repetition type B with UL-SCH, the number of coded modulation symbols per layer for CSI part 2 transmission, denoted as $\quad Q_{\text {CSI-part2 }}^{\prime}$, is determined as follows:
where

- $O_{\text {CSI-2 }}$ is the number of bits for CSI part 2;
- if $O_{\text {CSI-2 }}$, $L_{\text {CSI-2 }}=11$; otherwise $L_{\text {CSI-2 }}$ is the number of CRC bits for CSI part 2 determined according to Clause 6.3.1.2.1;
$-\quad \beta_{\text {offset }}^{\mathrm{PUSCH}}=\beta_{\text {offset }}^{\mathrm{CSI}-p a r t 2}$;
- $C_{\mathrm{UL}-\mathrm{SCH}}$ is the number of code blocks for UL-SCH of the PUSCH transmission;
- if the DCI format scheduling the PUSCH transmission includes a CBGTI field indicating that the UE shall not transmit the $r$-th code block, $K_{r}=0$; otherwise, $K_{r}$ is the $r$-th code block size for UL-SCH of the PUSCH transmission;
- $\quad M_{\mathrm{sc}}^{\mathrm{PUSCH}} \quad$ is the scheduled bandwidth of the PUSCH transmission, expressed as a number of subcarriers;
- $M_{\mathrm{sc}}^{\mathrm{PT}-\mathrm{RS}}(l)$ is the number of subcarriers in OFDM symbol $\quad l$ that carries PTRS, in the PUSCH transmission;
- $\quad Q_{A C K / C G-U C I}^{\prime}=Q_{A C K}^{\prime} \quad$ if HARQ-ACK is present for transmission on the same PUSCH with UL-SCH and without CG-UCI, where $\quad Q_{A C K}^{\prime} \quad$ is the number of coded modulation symbols per layer for HARQ-ACK transmitted on the PUSCH as defined in clause 6.3.2.4.1.1 if number of HARQ-ACK information bits is more than 2, and $Q^{\prime}{ }_{\text {ACK }}=0 \quad$ if the number of HARQ-ACK information bits is 1 or 2 bits; or
- $\quad Q_{A C K / C G-U C I}^{\prime}=Q_{A C K}^{\prime} \quad$ if both HARQ-ACK and CG-UCI are present on the same PUSCH with UL-SCH, where $Q_{A C K}^{\prime}$ is the number of coded modulation symbols per layer for HARQ-ACK and CG-UCI transmitted on the PUSCH as defined in clause 6.3.2.4.1.5; or
- $\quad Q_{A C K / C G-U C I}^{\prime}=Q_{C G-U C I}^{\prime} \quad$ if CG-UCI is present on the same PUSCH with UL-SCH and without HARQACK, where $Q_{C G-U C I}^{\prime}$ is the number of coded modulation symbols per layer for CG-UCI transmitted on the PUSCH as defined in clause 6.3.2.4.1.4;
- $Q^{\prime}{ }_{\text {CSI-1 }}$ is the number of coded modulation symbols per layer for CSI part 1 transmitted on the PUSCH;
- $\quad M_{\mathrm{sc}}^{\mathrm{UCI}}(l)$ is the number of resource elements that can be used for transmission of UCI in OFDM symbol $l$, for $l=0,1,2, \ldots, N_{\text {symb,all }}^{\text {PUSCH }}-1$, in the PUSCH transmission and $N_{\text {symb,all }}^{\text {PUSCH }}$ is the total number of OFDM symbols of the PUSCH, including all OFDM symbols used for DMRS;
- for any OFDM symbol that carries DMRS of the PUSCH, ${ }^{M_{\mathrm{sc}}^{\mathrm{UCI}}}(l)=0$;
- for any OFDM symbol that does not carry DMRS of the PUSCH, $M_{\mathrm{sc}}^{\mathrm{UCI}}(l)=M_{\mathrm{sc}}^{\mathrm{PUSCH}}-M_{\mathrm{sc}}^{\mathrm{PT}-\mathrm{RS}}(l)$.
- $\quad \alpha$ is configured by higher layer parameter scaling.

For CSI part 2 transmission on an actual repetition of a PUSCH with repetition Type B with UL-SCH, the number of coded modulation symbols per layer for CSI part 2 transmission, denoted as $Q_{\text {CSI-part } 2}^{\prime}$, is determined as follows:
where

- $\quad M_{\mathrm{sc}, \text { nominal }}^{\mathrm{UCI}}(l)$ is the number of resource elements that can be used for transmission of UCI in OFDM symbol $l$, for $l=0,1,2, \cdots, N_{\text {symb,nominal }}^{\text {PUSCH }}-1$, in the PUSCH transmission assuming a nominal repetition without segmentation, and $\quad N_{\text {symb,nominal }}^{\text {PUSCH }}$ is the total number of OFDM symbols in a nominal repetition of the PUSCH, including all OFDM symbols used for DMRS;
- for any OFDM symbol that carries DMRS of the PUSCH assuming a nominal repetition without segmentation, $\quad M_{\mathrm{sc}, \text { nominal }}^{\mathrm{UCI}}(l)=0 \quad$;
- for any OFDM symbol that does not carry DMRS of the PUSCH assuming a nominal repetition without segmentation, $\quad M_{\mathrm{sc}, \text { nominal }}^{\mathrm{UCI}}(l)=M_{\mathrm{sc}}^{\mathrm{PUSCH}}-M_{\mathrm{sc}, \text { nominal }}^{\mathrm{PT}-\text { SS }}(l) \quad$ where $\quad M_{\mathrm{sc}, \text { nominal }}^{\mathrm{PT} \text { RS }}(l) \quad$ is the number of subcarriers in OFDM symbol $l$ that carries PTRS, in the PUSCH transmission assuming a nominal repetition without segmentation;
- $\quad M_{\mathrm{sc}, \text { actual }}^{\mathrm{UCI}}(l)$ is the number of resource elements that can be used for transmission of UCI in OFDM symbol $l$, for $l=0,1,2, \cdots, N_{\text {symb,actual }}^{\text {PUSCH }}-1 \quad$, in the actual repetition of the PUSCH transmission, and $N_{\text {symb,actual }}^{\text {PUSCH }}$ is the total number of OFDM symbols in the actual repetition of the PUSCH transmission, including all OFDM symbols used for DMRS;
- for any OFDM symbol that carries DMRS of the actual repetition of the PUSCH transmission,

$$
M_{\mathrm{sc}, \mathrm{actual}}^{\mathrm{UCI}}(I)=0 ;
$$

- for any OFDM symbol that does not carry DMRS of the actual repetition of the PUSCH transmission, $M_{\mathrm{sc}, \text { actual }}^{\mathrm{UCI}}(l)=M_{\mathrm{sc}}^{\mathrm{PUSCH}}-M_{\mathrm{sc}, \text { actual }}^{\mathrm{PT}-\mathrm{RS}}(l) \quad$ where $\quad M_{\mathrm{sc}, \text { actual }}^{\mathrm{PT}}(l) \quad$ is the number of subcarriers in OFDM symbol $l$ that carries PTRS, in the actual repetition of the PUSCH transmission;
- and all the other notations in the formula are defined the same as for PUSCH not using repetition type B.

For CSI part 2 transmission on PUSCH without UL-SCH, the number of coded modulation symbols per layer for CSI part 2 transmission, denoted as $Q_{\text {CSI-part2 }}^{\prime}$, is determined as follows:

where

- $\quad M_{\mathrm{sc}}^{\mathrm{PUSCH}} \quad$ is the scheduled bandwidth of the PUSCH transmission, expressed as a number of subcarriers;
- $M_{\mathrm{sc}}^{\mathrm{PT}-\mathrm{RS}}(l)$ is the number of subcarriers in OFDM symbol $l$ that carries PTRS, in the PUSCH transmission;
- $Q^{\prime}$ ACK is the number of coded modulation symbols per layer for HARQ-ACK transmitted on the PUSCH if number of HARQ-ACK information bits is more than 2, and $Q^{\prime}{ }_{\text {ACK }}=0$ if the number of HARQ-ACK information bits is 1 or 2 bits;
- $Q^{\prime}$ CSI-1 is the number of coded modulation symbols per layer for CSI part 1 transmitted on the PUSCH;
- $\quad M_{\mathrm{sc}}^{\mathrm{UCI}}(l)$ is the number of resource elements that can be used for transmission of UCI in OFDM symbol $l$, for $l=0,1,2, \ldots, N_{\text {symb,all }}^{\text {PUSCH }}-1$, in the PUSCH transmission and $N_{\text {symb,all }}^{\text {PUSCH }}$ is the total number of OFDM symbols of the PUSCH, including all OFDM symbols used for DMRS;
- for any OFDM symbol that carries DMRS of the PUSCH, ${ }^{M_{\mathrm{sc}}^{\mathrm{UCI}}}(l)=0$;
- for any OFDM symbol that does not carry DMRS of the PUSCH, $M_{\mathrm{sc}}^{\mathrm{UCI}}(l)=M_{\mathrm{sc}}^{\mathrm{PUSCH}}-M_{\mathrm{sc}}^{\mathrm{PT}-\mathrm{RS}}(l)$.

The input bit sequence to rate matching is
$d_{r 0}, d_{r 1}, d_{r 2}, d_{r 3}, \ldots, d_{r\left(N_{r}-1\right)} \quad$ where $\quad r \quad$ is the code block number, and $N_{r}$ is the number of coded bits in code block number $r$.

Rate matching is performed according to Clause 5.4 .1 by setting $\quad I_{B L L}=1$ and the rate matching output sequence length to $E_{r}=\left\langle E_{\mathrm{UCI}} / C_{\mathrm{UCI}}\right\rfloor$, where

- $\quad C_{\mathrm{UCI}}$ is the number of code blocks for UCI determined according to Clause 5.2.1;
- $\quad N_{L} \quad$ is the number of transmission layers of the PUSCH;
- $Q_{m}$ is the modulation order of the PUSCH;
- $E_{\mathrm{UCI}}=N_{L} \cdot Q^{\prime}{ }_{\mathrm{CSI}, 2} \cdot Q_{m}$.

The output bit sequence after rate matching is denoted as $f_{r 0}, f_{r 1}, f_{r 2}, \ldots, f_{r\left(E_{r}-1\right)}$ where $E_{r}$ is the length of rate matching output sequence in code block number $r$.

### 6.3.2.4.1.4CG-UCI

For CG-UCI transmission on PUSCH with UL-SCH, the number of coded modulation symbols per layer for CG-UCI transmission, denoted as $Q_{C G-U C I}^{\prime}$, is determined as follows:
where

- $O_{C G-U C I}$ is the number of CG-UCI bits;
- $\quad L_{\text {CG-UCI }}$ is the number of CRC bits for CG-UCI determined according to Clause 6.3.1.2.1;
- $\quad \beta_{\text {offset }}^{\text {PUSH }}=\beta_{\text {offset }}^{\mathrm{CG}-U C I}$;
- $C_{U L-S C H}$ is the number of code blocks for UL-SCH of the PUSCH transmission;
- $\quad K_{r}$ is the $r$-th code block size for UL-SCH of the PUSCH transmission;
- $\quad M_{s c}^{\text {PUSCH }} \quad$ is the scheduled bandwidth of the PUSCH transmission, expressed as a number of subcarriers;
- $\quad M_{s c}^{P T-R S}(l) \quad$ is the number of subcarriers in OFDM symbol $l$ that carries PTRS, in the PUSCH transmission;
- $\quad M_{s c}^{U C I}(l)$ is the number of resource elements that can be used for transmission of UCI in OFDM symbol $l$, for $l=0,1,2, \ldots, \quad N_{\text {symb, all }}^{\text {PUSCH }}-1$, in the PUSCH transmission and $N_{\text {symb, all }}^{\text {PUSH }}$ is the total number of OFDM symbols of the PUSCH, including all OFDM symbols used for DMRS;
- for any OFDM symbol that carries DMRS of the PUSCH, $\quad M_{s c}^{U C I}(I)=0$;
- for any OFDM symbol that does not carry DMRS of the PUSCH, $\quad M_{s c}^{U C I}(I)=M_{s c}^{P U S C H}-M_{s c}^{P T-R S}(I)$;
- $\quad \alpha$ is configured by higher layer parameter scaling;
- $l_{0}$ is the symbol index of the first OFDM symbol that does not carry DMRS of the PUSCH, after the first DMRS symbol(s), in the PUSCH transmission.

The input bit sequence to rate matching is $d_{r 0}, d_{r 1}, d_{r 2}, d_{r 3}, \ldots, d_{r\left|N_{r}-1\right|}$ where $r$ is the code block number, and $N_{r}$ is the number of coded bits in code block number $r$.

Rate matching is performed according to Clause 5.4 .1 by setting $I_{B L L}=1$ and the rate matching output sequence length to $E_{r}=\left\lfloor E_{U C I} / C_{U C I}\right\rfloor$, where

- $C_{\text {UCI }}$ is the number of code blocks for UCI determined according to Clause 5.2.1;
- $\quad N_{L}$ is the number of transmission layers of the PUSCH;
- $Q_{m}$ is the modulation order of the PUSCH;
- $E_{U C I}=N_{L} \cdot Q_{C G-U C I}^{\prime} \cdot Q_{m}$.

The output bit sequence after rate matching is denoted as $f_{r 0}, f_{r 1}, f_{r 2}, \ldots, f_{\left.r \mid E_{-}-1\right)}$ where $\quad E_{r}$ is the length of rate matching output sequence in code block number $r$.

### 6.3.2.4.1.5HARQ-ACK and CG-UCI

For HARQ-ACK and CG-UCI transmission on PUSCH with UL-SCH, the number of coded modulation symbols per layer for HARQ-ACK and CG-UCI transmission, denoted as $Q_{A C K}^{\prime}$, is determined as follows:
where

- $O_{A C K}$ is the number of HARQ-ACK bits;
- $O_{\text {CG-UCI }}$ is the number of CG-UCI bits;
- if $O_{A C K}+O_{C G-U C I}>360, L_{A C K}=11$; otherwise $L_{A C K}$ is the number of CRC bits for HARQ-ACK and CG-UCI determined according to Clause 6.3.1.2.1;
- $\quad \beta_{\text {offset }}^{\text {PUSH }}=\beta_{\text {offset }}^{\text {HARQ-ACK }}$;
- $C_{U L-S C H}$ is the number of code blocks for UL-SCH of the PUSCH transmission;
- $\quad K_{r}$ is the $r$-th code block size for UL-SCH of the PUSCH transmission;
- $M_{s c}^{\text {PUSCH }}$ is the scheduled bandwidth of the PUSCH transmission, expressed as a number of subcarriers;
- $\quad M_{s c}^{P T-R S}(l) \quad$ is the number of subcarriers in OFDM symbol $l$ that carries PTRS, in the PUSCH transmission;
- $\quad M_{s c}^{U C I}(l)$ is the number of resource elements that can be used for transmission of UCI in OFDM symbol $l$, for $l=0,1,2, \ldots, \quad N_{\text {symb, all }}^{\text {PUSCH }}-1$, in the PUSCH transmission and $N_{\text {symb, all }}^{\text {PUSCH }}$ is the total number of OFDM symbols of the PUSCH, including all OFDM symbols used for DMRS;
- for any OFDM symbol that carries DMRS of the PUSCH, $\quad M_{s c}^{U C I}(l)=0$;
- for any OFDM symbol that does not carry DMRS of the PUSCH, $\quad M_{\mathrm{sc}}^{U C I}(l)=M_{\mathrm{sc}}^{P U S C H}-M_{s c}^{P T-R S}(l)$;
- $\quad \alpha$ is configured by higher layer parameter scaling;
- $l_{0}$ is the symbol index of the first OFDM symbol that does not carry DMRS of the PUSCH, after the first DMRS symbol(s), in the PUSCH transmission.

The input bit sequence to rate matching is $d_{r 0}, d_{r 1}, d_{r 2}, d_{r 3}, \ldots, d_{r\left|N_{r}-1\right|}$ where $r$ is the code block number, and $N_{r}$ is the number of coded bits in code block number $r$.

Rate matching is performed according to Clause 5.4 .1 by setting $I_{B L L}=1$ and the rate matching output sequence length to $E_{r}=\left\lfloor E_{U C I} / C_{U C I}\right\rfloor$, where

- $C_{U C I}$ is the number of code blocks for UCI determined according to Clause 5.2.1;
- $\quad N_{L}$ is the number of transmission layers of the PUSCH;
- $Q_{m}$ is the modulation order of the PUSCH;
- $E_{U C I}=N_{L} \cdot Q_{A C K}^{\prime} \cdot Q_{m}$.

The output bit sequence after rate matching is denoted as $f_{r 0}, f_{r 1}, f_{r 2}, \ldots, f_{r\left|E_{r}-1\right|}$ where $\quad E_{r}$ is the length of rate matching output sequence in code block number $r$.

### 6.3.2.4.2 UCI encoded by channel coding of small block lengths

### 6.3.2.4.2.1HARQ-ACK

For HARQ-ACK transmission on PUSCH, the number of coded modulation symbols per layer for HARQ-ACK transmission, denoted as $Q_{A C K}^{\prime}$, is determined according to Clause 6.3.2.4.1.1, by setting the number of CRC bits $L=0$

The input bit sequence to rate matching is $d_{0}, d_{1}, d_{2}, \ldots, d_{N-1}$.
Rate matching is performed according to Clause 5.4.3, by setting the rate matching output sequence length $E=N_{L} \cdot Q^{\prime}{ }_{\text {ACK }} \cdot Q_{m}$, where

- $\quad N_{L}$ is the number of transmission layers of the PUSCH;
- $Q_{m}$ is the modulation order of the PUSCH.

The output bit sequence after rate matching is denoted as $f_{0}, f_{1}, f_{2}, \ldots, f_{E-1}$.
6.3.2.4.2.2CSI part 1

For CSI part 1 transmission on PUSCH, the number of coded modulation symbols per layer for CSI part 1 transmission, denoted as $Q_{\text {CSI,1 }}^{\prime} \quad$, is determined according to Clause 6.3.2.4.1.2, by setting the number of CRC bits $\quad L=0$.

Rate matching is performed according to Clause 5.4.3, by setting the rate matching output sequence length
$E=N_{L} \cdot Q^{\prime}{ }_{\mathrm{CSI}, 1} \cdot Q_{m}$, where

- $\quad N_{L} \quad$ is the number of transmission layers of the PUSCH;
- $Q_{m}$ is the modulation order of the PUSCH.

The output bit sequence after rate matching is denoted as $f_{0}, f_{1}, f_{2}, \ldots, f_{E-1}$.
6.3.2.4.2.3CSI part 2

For CSI part 2 transmission on PUSCH, the number of coded modulation symbols per layer for CSI part 2 transmission, denoted as $Q_{C S I, 2}^{\prime}$, is determined according to Clause 6.3.2.4.1.3, by setting the number of CRC bits $L=0$.

Rate matching is performed according to Clause 5.4.3, by setting the rate matching output sequence length $E=N_{L} \cdot Q^{\prime}{ }_{\mathrm{CSI}, 2} \cdot Q_{m}$, where

- $\quad N_{L}$ is the number of transmission layers of the PUSCH;
- $Q_{m}$ is the modulation order of the PUSCH.

The output bit sequence after rate matching is denoted as $f_{0}, f_{1}, f_{2}, \ldots, f_{E-1}$.

### 6.3.2.4.2.4CG-UCI

For CG-UCI transmission on PUSCH, the number of coded modulation symbols per layer for CG-UCI transmission, denoted as $Q_{C G-U C I}^{\prime}$, is determined according to Clause 6.3.2.4.1.4, by setting the number of CRC bits $L_{C G-U C I}=0$.

The input bit sequence to rate matching is

$$
d_{0}, d_{1}, d_{2}, \ldots, d_{N-1}
$$

Rate matching is performed according to Clause 5.4.3, by setting the rate matching output sequence length
$E=N_{L} \cdot Q_{C G-U C I}^{\prime} \cdot Q_{m}$, where

- $\quad N_{L}$ is the number of transmission layers of the PUSCH;
- $Q_{m}$ is the modulation order of the PUSCH.

The output bit sequence after rate matching is denoted as $f_{0}, f_{1}, f_{2}, \ldots, f_{E-1}$.

### 6.3.2.4.2.5HARQ-ACK and CG-UCI

For HARQ-ACK and CG-UCI transmission on PUSCH, the number of coded modulation symbols per layer for HARQACK and CG-UCI transmission, denoted as $Q_{A C K}^{\prime}$, is determined according to Clause 6.3.2.4.1.5, by setting the number of CRC bits $\quad L_{A C K}=0$.

The input bit sequence to rate matching is $\quad d_{0}, d_{1}, d_{2}, \ldots, d_{N-1}$.
Rate matching is performed according to Clause 5.4.3, by setting the rate matching output sequence length $E=N_{L} \cdot Q_{A C K}^{\prime} \cdot Q_{m}$, where

- $\quad N_{L}$ is the number of transmission layers of the PUSCH;
- $Q_{m}$ is the modulation order of the PUSCH.

The output bit sequence after rate matching is denoted as $f_{0}, f_{1}, f_{2}, \ldots, f_{E-1}$.

### 6.3.2.5 Code block concatenation

Code block concatenation is performed according to Clause 6.3.1.5, except that the values of $\quad E_{\text {UCI }} \quad$ and $\quad C_{\text {UCI }}$ given in Clause 6.3.2.4.1.

### 6.3.2.6 Multiplexing of coded UCI bits to PUSCH

The coded UCI bits are multiplexed onto PUSCH according to the procedures in Clause 6.2.7.

## 7 Downlink transport channels and control information <br> 7.1 Broadcast channel

Data arrives to the coding unit in the form of a maximum of one transport block every 80ms. The following coding steps can be identified:

- Payload generation
- Scrambling
- Transport block CRC attachment
- Channel coding
- Rate matching

### 7.1.1 PBCH payload generation

Denote the bits in a transport block delivered to layer 1 by $\bar{a}_{0}, \bar{a}_{1}, \bar{a}_{2}, \bar{a}_{3}, \ldots, \bar{a}_{\bar{A}-1}$, where $\bar{A}$ is the payload size generated by higher layers. The lowest order information bit $\bar{a}_{0}$ is mapped to the most significant bit of the transport block as defined in Clause 6.1.1 of [8, TS 38.321].

Generate the following additional timing related PBCH payload bits $\bar{a}_{\bar{A}}, \bar{a}_{\bar{A}+1}, \bar{a}_{\bar{A}+2}, \bar{a}_{\bar{A}+3}, \ldots, \bar{a}_{\bar{A}+7}$, where:

- $\bar{a}_{\bar{A}}, \bar{a}_{\bar{A}+1}, \bar{a}_{\bar{A}+2}, \bar{a}_{\bar{A}+3}$ are the $4^{\text {th }}, 3^{\text {rd }}, 2^{\text {nd }}$, and $1^{\text {st }}$ LSB of SFN, respectively;
- $\bar{a}_{\bar{A}+4}$ is the half frame bit $\bar{a}_{\text {HRF }}$;
- if $\bar{L}_{\max }=10$ as defined in Clause 4.1 of [5, TS38.213],
$\dot{a}_{\dot{A}+5} \quad$ is the MSB of $\quad k_{\text {SSB }} \quad$ as defined in Clause 7.4.3.1 of [4, TS 38.211].
$\dot{a}_{A+6}$ is reserved.
$\dot{a}_{\dot{A}+7}$ is the MSB of candidate SS/PBCH block index.
- else if $\bar{L}_{\max }=20$ as defined in Clause 4.1 of [5, TS38.213],
$\dot{a}_{A+5} \quad$ is the MSB of $\quad k_{\text {SSB }} \quad$ as defined in Clause 7.4.3.1 of [4, TS 38.211].
$\dot{a}_{\dot{A}+6}, \dot{a}_{\dot{A}+7} \quad$ are the $5^{\text {th }}$ and $4^{\text {th }}$ bits of the candidate SS/PBCH block index, respectively.
- else if $\bar{L}_{\max }=64$ as defined in Clause 4.1 of [5, TS38.213],
$\dot{a}_{\dot{A}+5}, \quad \dot{a}_{\dot{A}+6}, \quad \dot{a}_{\dot{A}+7} \quad$ are the $6^{\text {th }}, 5^{\text {th }}$, and $4^{\text {th }}$ bits of the candidate SS/PBCH block index, respectively.
- else
$\dot{a}_{A+5}$ is the MSB of $\quad k_{\text {SSB }} \quad$ as defined in Clause 7.4.3.1 of [4, TS 38.211].
$\dot{a}_{\dot{A}+6}, \quad \dot{a}_{\dot{A}+7}$ are reserved.
- end if

Let $A=\bar{A}+8 ; j_{\mathrm{SFN}}=0 ; j_{\mathrm{HRF}}=10 ; j_{\mathrm{SSB}}=11 ; j_{\text {other }}=14$;
for $i=0$ to $A-1$
if $\bar{a}_{i}$ is an SFN bit

$$
\begin{aligned}
& a_{G\left(j_{\mathrm{SFN}}\right)}=\bar{a}_{i} \\
& j_{\mathrm{SFN}}=j_{\mathrm{SFN}}+1
\end{aligned}
$$

elseif $\bar{a}_{i}$

$$
a_{G\left(j_{\mathrm{HRF}}\right)}=\bar{a}_{i}
$$

elseif

$$
\bar{A}+5 \leq i \leq \bar{A}+7
$$

$$
\begin{aligned}
& a_{G\left(j_{S S B}\right)}=\bar{a}_{i} \\
& j_{\mathrm{SSB}}=j_{\mathrm{SSB}}+1
\end{aligned}
$$

else

$$
\begin{aligned}
& a_{G\left(j_{\text {Other }}\right.}=\bar{a}_{i} \\
& j_{\text {Other }}=j_{\text {Other }}+1
\end{aligned}
$$

end if
end for
where $\bar{L}_{\text {max }}$ is the number of candidate SS/PBCH blocks in a half frame according to Clause 4.1 of [5, TS38.213], and the value of $G(j)$ is given by Table 7.1.1-1.

Table 7.1.1-1: Value of PBCH payload interleaver pattern $G(j)$

| $j$ | $G\|j\|$ | $j$ | $G \mid j$ | $j$ | $G \mid j$ | $j$ | $G(j)$ | $j$ | $G \mid j)$ | $j$ | $G(j)$ | $j$ | $G \mid j)$ | $j$ | $G(j)$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 16 | 4 | 8 | 8 | 24 | 12 | 3 | 16 | 9 | 20 | 14 | 24 | 21 | 28 | 27 |
| 1 | 23 | 5 | 30 | 9 | 7 | 13 | 2 | 17 | 11 | 21 | 15 | 25 | 22 | 29 | 28 |
| 2 | 18 | 6 | 10 | 10 | 0 | 14 | 1 | 18 | 12 | 22 | 19 | 26 | 25 | 30 | 29 |
| 3 | 17 | 7 | 6 | 11 | 5 | 15 | 4 | 19 | 13 | 23 | 20 | 27 | 26 | 31 | 31 |

### 7.1.2 Scrambling

For PBCH transmission in a frame, the bit sequence $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$ is scrambled into a bit sequence $a_{0}^{\prime}, a_{1}^{\prime}, a_{2}^{\prime}, a_{3}^{\prime}, \ldots, a_{A-1}^{\prime}$, where $a_{i}^{\prime}=\left(a_{i}+s_{i}\right) \bmod 2$ for $i=0,1, \ldots, A-1$ and $s_{0}, s_{1}, s_{2}, s_{3}, \ldots, s_{A-1}$ is generated according to the following:

$$
\begin{aligned}
& i=0 ; \\
& j=0 ;
\end{aligned}
$$

while $i<A$
if $\quad a_{i}$ corresponds to any one of the bits belonging to the candidate SS/PBCH block index, the half frame index, and $2^{\text {nd }}$ and $3^{\text {rd }}$ least significant bits of the system frame number

$$
s_{i}=0 ;
$$

else

$$
\begin{aligned}
& s_{i}=c(j+v M) \\
& j=j+1
\end{aligned}
$$

end if

$$
i=i+1 ;
$$

end while

The scrambling sequence $c(i)$ is given by Clause 5.2.1of [4, TS38.211] and initialized with $c_{\text {init }}=N_{\text {ID }}^{\text {cell }}$ at the start of each SFN satisfying $\bmod (S F N, 8)=0 \quad ; \quad M=A-3$ for $L_{\max }=4$ or $L_{\max }=8, \quad M=A-4$ for $\bar{L}_{\max }=10, M=A-5$ for $\bar{L}_{\max }=20$, and $M=A-6$ for $\bar{L}_{\max }=64$, where $\bar{L}_{\max }$ is the number of candidate SS/PBCH blocks in a half frame according to Clause 4.1 of [5, TS38.213]; and $v$ is determined according to Table 7.1.2-1 using the $3^{\text {rd }}$ and $2^{\text {nd }}$ LSB of the SFN in which the PBCH is transmitted.

Table 7.1.2-1: Value of $v$ for PBCH scrambling

| ${\text { ( } \mathbf{3}^{\text {rd }}}^{\text {LSB }}$ of SFN, $\mathbf{2}^{\text {nd }}$ LSB of SFN $)$ | Value of <br> $v$ |
| :---: | :---: |
| $(0,0)$ | 0 |
| $(0,1)$ | 1 |
| $(1,0)$ | 2 |
| $(1,1)$ | 3 |

### 7.1.3 Transport block CRC attachment

Error detection is provided on BCH transport blocks through a Cyclic Redundancy Check (CRC).
The entire transport block is used to calculate the CRC parity bits. The input bit sequence is denoted by $a_{0}^{\prime}, a_{1}^{\prime}, a_{2}^{\prime}, a_{3}^{\prime}, \ldots, a^{\prime}{ }_{A-1}$, and the parity bits by $p_{0}, p_{1}, p_{2}, p_{3}, \ldots, p_{L-1}$, where $A$ is the payload size and $L$ is the number of parity bits.
The parity bits are computed and attached to the BCH transport block according to Clause 5.1 by setting $L$ to 24 bits and using the generator polynomial $g_{\text {CRC24C }}(D)$, resulting in the sequence $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$, where $B=A+L$.

The bit sequence $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$ is the input bit sequence $c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{K-1}$ to the channel encoder, where $c_{i}=b_{i} \quad$ for $i=0,1, \ldots, B-1$ and $K=B$.

### 7.1.4 Channel coding

Information bits are delivered to the channel coding block. They are denoted by $c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{K-1}$, where $K$ is the number of bits, and they are encoded via Polar coding according to Clause 5.3.1, by setting $n_{\max }=9, I_{I L}=1$,

$$
n_{P C}=0 \text {, and } n_{P C}^{w m}=0 \text {. }
$$

After encoding the bits are denoted by

$$
d_{0}, d_{1}, d_{2}, d_{3}, \ldots, d_{N-1} \text {, where } N \text { is the number of coded bits. }
$$

### 7.1.5 Rate matching

The input bit sequence to rate matching is

$$
d_{0}, d_{1}, d_{2}, \ldots, d_{N-1} .
$$

The rate matching output sequence length

$$
E=864
$$

Rate matching is performed according to Clause 5.4 .1 by setting $I_{B L}=0$.
The output bit sequence after rate matching is denoted as $f_{0}, f_{1}, f_{2}, \ldots, f_{\mathrm{E}-1}$.

### 7.2 Downlink shared channel and paging channel

### 7.2.1 Transport block CRC attachment

Error detection is provided on each transport block through a Cyclic Redundancy Check (CRC).

The entire transport block is used to calculate the CRC parity bits. Denote the bits in a transport block delivered to layer 1 by $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$, and the parity bits by $p_{0}, p_{1}, p_{2}, p_{3}, \ldots, p_{L-1}$, where $A$ is the payload size and
$L$ is the number of parity bits. The lowest order information bit $a_{0}$ is mapped to the most significant bit of the transport block as defined in Clause 6.1.1 of [TS38.321].

The parity bits are computed and attached to the DL-SCH transport block according to Clause 5.1, by setting $L$ to 24 bits and using the generator polynomial $\quad g_{\text {CRC24A }}(D) \quad$ if $\quad A>3824$; and by setting $L \quad$ to 16 bits and using the generator polynomial $g_{\mathrm{CRC16}}(D)$ otherwise.

The bits after CRC attachment are denoted by $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$, where $B=A+L$.

### 7.2.2 LDPC base graph selection

For initial transmission of a transport block with coding rate $\quad R \quad$ indicated by the MCS index according to Clause 5.1.3.1 in [6, TS 38.214] and subsequent re-transmission of the same transport block, each code block of the transport block is encoded with either LDPC base graph 1 or 2 according to the following:

- if $A \leq 292$, or if $A \leq 3824$ and $R \leq 0.67$, or if $R \leq 0.25$, LDPC base graph 2 is used;
- otherwise, LDPC base graph 1 is used,
where $A$ is the payload size in Clause 7.2.1.

### 7.2.3 Code block segmentation and code block CRC attachment

The bits input to the code block segmentation are denoted by $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$ where $B$ is the number of bits in the transport block (including CRC).

Code block segmentation and code block CRC attachment are performed according to Clause 5.2.2.
The bits after code block segmentation are denoted by

$$
c_{r 0}, c_{r 1}, c_{r 2}, c_{r 3}, \ldots, c_{r\left|K_{r}-1\right|} \text {, where } r \quad \text { is the code block }
$$ number and $K_{r}$ is the number of bits for code block number $\quad r \quad$ according to Clause 5.2.2.

### 7.2.4 Channel coding

Code blocks are delivered to the channel coding block. The bits in a code block are denoted by $c_{r 0}, c_{r 1}, c_{r 2}, c_{r 3}, \ldots, c_{r\left(K_{r}-1\right)}$, where $r$ is the code block number, and $K_{r}$ is the number of bits in code block number $\quad r$. The total number of code blocks is denoted by $C$ and each code block is individually LDPC encoded according to Clause 5.3.2.

After encoding the bits are denoted by
$d_{r 0}, d_{r 1}, d_{r 2}, d_{r 3}, \ldots, d_{r\left(N_{r}-1\right)}$, where the values of $\quad N_{r} \quad$ is given in Clause 5.3.2.

### 7.2.5 Rate matching

Coded bits for each code block, denoted as $d_{r 0}, d_{r 1}, d_{r 2}, d_{r 3}, \ldots, d_{r\left|N_{r}-1\right\rangle}$, are delivered to the rate match block, where
$r$ is the code block number, and $N_{r}$ is the number of encoded bits in code block number $r$. The total number of code blocks is denoted by $C$ and each code block is individually rate matched according to Clause 5.4.2 by setting $I_{\text {LBRM }}=1$.

After rate matching, the bits are denoted by $f_{r 0}, f_{r 1}, f_{r 2}, f_{r 3}, \ldots, f_{r\left|E_{r}-1\right|}$, where $E_{r}$ is the number of rate matched bits for code block number $r$.

### 7.2.6 Code block concatenation

The input bit sequence for the code block concatenation block are the sequences

$$
f_{r 0}, f_{r 1}, f_{r 2}, f_{r 3}, \ldots, f_{r\left|E_{r}-1\right|} \text {, for }
$$ $r=0, \ldots, C-1$ and where $E_{r}$ is the number of rate matched bits for the $r$-th code block.

Code block concatenation is performed according to Clause 5.5.
The bits after code block concatenation are denoted by $g_{0}, g_{1}, g_{2}, g_{3}, \ldots, g_{G-1}$, where $G$ is the total number of coded bits for transmission.

### 7.3 Downlink control information

A DCI transports downlink control information for one or more cells with one RNTI.
The following coding steps can be identified:

- Information element multiplexing
- CRC attachment
- Channel coding
- Rate matching

### 7.3.1 DCI formats

The DCI formats defined in table 7.3.1-1 are supported.
Table 7.3.1-1: DCI formats

| DCI format |  |
| :---: | :--- |
| $0 \_0$ | Scheduling of PUSCH in one cell |
| $0 \_1$ | Scheduling of one or multiple PUSCH in one cell, or <br> indicating downlink feedback information for configured <br> grant PUSCH (CG-DFI) |
| $0 \_2$ | Scheduling of PUSCH in one cell |
| $1 \_0$ | Scheduling of PDSCH in one cell |
| $1 \_1$ | Scheduling of PDSCH in one cell, and/or triggering one <br> shot HARQ-ACK codebook feedback |
| $1 \_2$ | Scheduling of PDSCH in one cell |
| $2 \_0$ | Notifying a group of UEs of the slot format, available RB <br> sets, COT duration and search space set group switching |
| $2 \_1$ | Notifying a group of UEs of the PRB(s) and OFDM <br> symbol(s) where UE may assume no transmission is <br> intended for the UE |
| $2 \_2$ | Transmission of TPC commands for PUCCH and PUSCH |
| $2 \_3$ | Transmission of a group of TPC commands for SRS <br> transmissions by one or more UEs |
| $2 \_4$ | Notifying a group of UEs of the PRB(s) and OFDM <br> symbol(s) where UE cancels the corresponding UL <br> transmission from the UE |
| $2 \_5$ | Notifying the availability of soft resources as defined in <br> Clause 9.3.1 of [10, TS 38.473] |
| $2 \_6$ | Notifying the power saving information outside DRX Active <br> Time for one or more UEs |
| $3 \_0$ | Scheduling of NR sidelink in one cell |
| $3 \_1$ | Scheduling of LTE sidelink in one cell |
| 2 |  |

The fields defined in the DCI formats below are mapped to the information bits $a_{0}$ to $a_{A-1}$ as follows.

Each field is mapped in the order in which it appears in the description, including the zero-padding bit(s), if any, with the first field mapped to the lowest order information bit $a_{0}$ and each successive field mapped to higher order information bits. The most significant bit of each field is mapped to the lowest order information bit for that field, e.g. the most significant bit of the first field is mapped to $a_{0}$

If the number of information bits in a DCI format is less than 12 bits, zeros shall be appended to the DCI format until the payload size equals 12 .

The size of each DCI format is determined by the configuration of the corresponding active bandwidth part of the scheduled cell and shall be adjusted as described in clause 7.3.1.0 if necessary.

### 7.3.1.0 DCI size alignment

If necessary, padding or truncation shall be applied to the DCI formats according to the following steps executed in the order below:

Step 0:

- Determine DCI format $0 \_0$ monitored in a common search space according to clause 7.3.1.1.1 where $N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}$ is the size of the initial UL bandwidth part.
- Determine DCI format $1 \_0$ monitored in a common search space according to clause 7.3.1.2.1 where $N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}$ is given by
- the size of CORESET 0 if CORESET 0 is configured for the cell; and
- the size of initial DL bandwidth part if CORESET 0 is not configured for the cell.
- If DCI format $0 \_0$ is monitored in common search space and if the number of information bits in the DCI format $0 \_0$ prior to padding is less than the payload size of the DCI format $1 \_0$ monitored in common search space for scheduling the same serving cell, a number of zero padding bits are generated for the DCI format $0 \_0$ until the payload size equals that of the DCI format 1_0.
- If DCI format $0 \_0$ is monitored in common search space and if the number of information bits in the DCI format $0 \_0$ prior to truncation is larger than the payload size of the DCI format $1 \_0$ monitored in common search space for scheduling the same serving cell, the bitwidth of the frequency domain resource assignment field in the DCI format $0 \_0$ is reduced by truncating the first few most significant bits such that the size of DCI format $0 \_0$ equals the size of the DCI format $1 \_0$.

Step 1:

- Determine DCI format 0_0 monitored in a UE-specific search space according to clause 7.3.1.1.1 where $N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}} \quad$ is the size of the active UL bandwidth part.
- Determine DCI format 1_0 monitored in a UE-specific search space according to clause 7.3.1.2.1 where $N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}$ is the size of the active DL bandwidth part.
- For a UE configured with supplementaryUplink in ServingCellConfig in a cell, if PUSCH is configured to be transmitted on both the SUL and the non-SUL of the cell and if the number of information bits in DCI format $0 \_0$ in UE-specific search space for the SUL is not equal to the number of information bits in DCI format $0 \_0$ in UE-specific search space for the non-SUL, a number of zero padding bits are generated for the smaller DCI format $0 \_0$ until the payload size equals that of the larger DCI format $0 \_0$.
- If DCI format $0 \_0$ is monitored in UE-specific search space and if the number of information bits in the DCI format $0 \_0$ prior to padding is less than the payload size of the DCI format $1 \_0$ monitored in UE-specific search space for scheduling the same serving cell, a number of zero padding bits are generated for the DCI format $0 \_0$ until the payload size equals that of the DCI format $1 \_0$.
- If DCI format $1 \_0$ is monitored in UE-specific search space and if the number of information bits in the DCI format $1 \_0$ prior to padding is less than the payload size of the DCI format $0 \_0$ monitored in UE-specific search
space for scheduling the same serving cell, zeros shall be appended to the DCI format $1 \_0$ until the payload size equals that of the DCI format 0_0

Step 2:

- Determine DCI format 0_1 monitored in a UE-specific search space according to clause 7.3.1.1.2.
- Determine DCI format 1_1 monitored in a UE-specific search space according to clause 7.3.1.2.2.
- For a UE configured with supplementaryUplink in ServingCellConfig in a cell, if PUSCH is configured to be transmitted on both the SUL and the non-SUL of the cell and if the number of information bits in format $0 \_1$ for the SUL is not equal to the number of information bits in format $0 \_1$ for the non-SUL, zeros shall be appended to smaller format $0 \_1$ until the payload size equals that of the larger format $0 \_1$.
- If the size of DCI format $0 \_1$ monitored in a UE-specific search space equals that of a DCI format $0 \_0 / 1 \_0$ monitored in another UE-specific search space, one bit of zero padding shall be appended to DCI format $0 \_1$.
- If the size of DCI format $1 \_1$ monitored in a UE-specific search space equals that of a DCI format $0 \_0 / 1 \_0$ monitored in another UE-specific search space, one bit of zero padding shall be appended to DCI format $1 \_1$.

Step 2A:

- Determine DCI format $0 \_2$ monitored in a UE-specific search space according to clause 7.3.1.1.3.
- Determine DCI format $1 \_2$ monitored in a UE-specific search space according to clause 7.3.1.2.3.
- For a UE configured with supplementaryUplink in ServingCellConfig in a cell, if PUSCH is configured to be transmitted on both the SUL and the non-SUL of the cell and if the number of information bits in format $0 \_2$ for the SUL is not equal to the number of information bits in format $0 \_2$ for the non-SUL, zeros shall be appended to smaller format $0 \_2$ until the payload size equals that of the larger format $0 \_2$.

Step 3:

- If both of the following conditions are fulfilled the size alignment procedure is complete
- the total number of different DCI sizes configured to monitor is no more than 4 for the cell
- the total number of different DCI sizes with C-RNTI configured to monitor is no more than 3 for the cell

Step 4:

- Otherwise

Step 4A:

- Remove the padding bit (if any) introduced in step 2 above.
- Determine DCI format 1_0 monitored in a UE-specific search space according to clause 7.3.1.2.1 where $N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}$ is given by
- the size of CORESET 0 if CORESET 0 is configured for the cell; and
- the size of initial DL bandwidth part if CORESET 0 is not configured for the cell.
- Determine DCI format 0_0 monitored in a UE-specific search space according to clause 7.3.1.1.1 where $N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}$ is the size of the initial UL bandwidth part.
- If the number of information bits in the DCI format 0_0 monitored in a UE-specific search space prior to padding is less than the payload size of the DCI format $1 \_0$ monitored in UE-specific search space for scheduling the same serving cell, a number of zero padding bits are generated for the DCI format 0_0 monitored in a UE-specific search space until the payload size equals that of the DCI format $1 \_0$ monitored in a UE-specific search space.
- If the number of information bits in the DCI format $0 \_0$ monitored in a UE-specific search space prior to truncation is larger than the payload size of the DCI format 1_0 monitored in UE-specific search space for scheduling the same serving cell, the bitwidth of the frequency domain resource assignment field in the DCI
format $0 \_0$ is reduced by truncating the first few most significant bits such that the size of DCI format $0 \_0$ monitored in a UE-specific search space equals the size of the DCI format 1_0 monitored in a UE-specific search space.

Step 4B:

- If the total number of different DCI sizes configured to monitor is more than 4 for the cell after applying the above steps, or if the total number of different DCI sizes with C-RNTI configured to monitor is more than 3 for the cell after applying the above steps
- If the number of information bits in the DCI format $0 \_2$ prior to padding is less than the payload size of the DCI format $1 \_2$ for scheduling the same serving cell, a number of zero padding bits are generated for the DCI format $0 \_2$ until the payload size equals that of the DCI format $1 \_2$.
- If the number of information bits in the DCI format $1 \_2$ prior to padding is less than the payload size of the DCI format $0 \_2$ for scheduling the same serving cell, zeros shall be appended to the DCI format $1 \_2$ until the payload size equals that of the DCI format $0 \_2$.

Step 4C:

- If the total number of different DCI sizes configured to monitor is more than 4 for the cell after applying the above steps, or if the total number of different DCI sizes with C-RNTI configured to monitor is more than 3 for the cell after applying the above steps
- If the number of information bits in the DCI format $0 \_1$ prior to padding is less than the payload size of the DCI format $1 \_1$ for scheduling the same serving cell, a number of zero padding bits are generated for the DCI format $0 \_1$ until the payload size equals that of the DCI format $1 \_1$.
- If the number of information bits in the DCI format $1 \_1$ prior to padding is less than the payload size of the DCI format $0 \_1$ for scheduling the same serving cell, zeros shall be appended to the DCI format $1 \_1$ until the payload size equals that of the DCI format $0 \_1$.

The UE is not expected to handle a configuration that, after applying the above steps, results in

- the total number of different DCI sizes configured to monitor is more than 4 for the cell; or
- the total number of different DCI sizes with C-RNTI configured to monitor is more than 3 for the cell; or
- the size of DCI format $0 \_0$ in a UE-specific search space is equal to DCI format $0 \_1$ in another UE-specific search space; or
- the size of DCI format $1 \_0$ in a UE-specific search space is equal to DCI format $1 \_1$ in another UE-specific search space; or
- the size of DCI format $0 \_0$ in a UE-specific search space is equal to DCI format $0 \_2$ in another UE-specific search space when at least one pair of the corresponding PDCCH candidates of DCI formats $0 \_0$ and $0 \_2$ are mapped to the same resource; or
- the size of DCI format $1 \_0$ in a UE-specific search space is equal to DCI format $1 \_2$ in another UE-specific search space when at least one pair of the corresponding PDCCH candidates of DCI formats $1 \_0$ and $1 \_2$ are mapped to the same resource; or
- the size of DCI format $0 \_1$ in a UE-specific search space is equal to DCI format $0 \_2$ in the same or another UEspecific search space when at least one pair of the corresponding PDCCH candidates of DCI formats $0 \_1$ and $0 \_2$ are mapped to the same resource; or
- the size of DCI format $1 \_1$ in a UE-specific search space is equal to DCI format $1 \_2$ in the same or another UEspecific search space when at least one pair of the corresponding PDCCH candidates of DCI formats 1_1 and $1 \_2$ are mapped to the same resource.

### 7.3.1.0.1 $\quad \mathrm{DCI}$ size alignment for DCI formats for scheduling of sidelink

If DCI format 3_0 or DCI format 3_1 is monitored on a cell, DCI size alignment for DCI format 3_0 and DCI format $3 \_1$ is performed as described in this clause after performing the DCI size alignment described in Clause 7.3.1.0. The
size(s) of the DCI formats configured to monitor for a cell in this clause refers to that after performing the DCI size alignment described in Clause 7.3.1.0.

If DCI format 3_0 or DCI format 3_1 is monitored on a cell and the total number of DCI sizes of the DCI formats configured to monitor for the cell and DCI format $3 \_0$ or DCI format $3 \_1$ is more than 4 , zeros shall be appended to DCI format 3_0 if configured and DCI format 3_1 if configured, until the payload size of DCI format 3_0 or DCI format 3_1 equals that of the smallest DCI format configured to monitor for the cell that is larger than DCI format 3_0 or DCI format 3_1.

The UE is not expected to handle a configuration that results in:

- the total number of different DCI sizes configured to monitor for the cell and DCI format 3_0 or DCI format 3_1 is more than 4 ; and
- the payload size of DCI format 3_0 or DCI format 3_1 is larger than the payload size of all other DCI formats configured to monitor for the cell.

### 7.3.1.1 DCI formats for scheduling of PUSCH

### 7.3.1.1.1 Format 0_0

DCI format $0 \_0$ is used for the scheduling of PUSCH in one cell.
The following information is transmitted by means of the DCI format $0 \_0$ with CRC scrambled by C-RNTI or CSRNTI or MCS-C-RNTI:

- Identifier for DCI formats - 1 bit
- The value of this bit field is always set to 0 , indicating an UL DCI format
- Frequency domain resource assignment - $\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil$ bits if neither of the higher layer parameters useInterlacePUCCH-PUSCH in BWP-UplinkCommon and useInterlacePUCCH-PUSCH in BWPUplinkDedicated is configured, where $N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}$ is defined in clause 7.3.1.0
- For PUSCH hopping with resource allocation type 1:
- $\quad N_{\text {UL_hop }} \quad$ MSB bits are used to indicate the frequency offset according to Clause 6.3 of [6, TS 38.214], where $N_{\text {UL_hop }}=1$ if the higher layer parameter frequencyHoppingOffsetLists contains two offset values and $\quad N_{\text {UL_hop }}=2$ if the higher layer parameter frequencyHoppingOffsetLists contains four offset values
- $\quad\left[\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}+1\right) / 2\right)\right]-N_{\mathrm{UL} \_ \text {hop }} \quad$ bits provides the frequency domain resource allocation according to Clause 6.1.2.2.2 of [6, TS 38.214]
- For non-PUSCH hopping with resource allocation type 1:
- $\quad\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil$ bits provides the frequency domain resource allocation according to Clause 6.1.2.2.2 of [6, TS 38.214]
- if any of the higher layer parameters useInterlacePUCCH-PUSCH in BWP-UplinkCommon and useInterlacePUCCH-PUSCH in BWP-UplinkDedicated is configured
- 5+Y bits provide the frequency domain resource allocation according to Clause 6.1.2.2.3 of [6, TS 38.214] if the subcarrier spacing for the active UL bandwidth part is 30 kHz .
- 6+Y bits provide the frequency domain resource allocation according to Clause 6.1.2.2.3 of [6, TS 38.214] if the subcarrier spacing for the active UL bandwidth part is 15 kHz .

If the DCI format $0 \_0$ is monitored in a UE-specific search space, the value of Y is determined by
$\left\lceil\log _{2}\left(\frac{N_{\mathrm{RB} \text {-set,UL }}^{\mathrm{BWP}}\left(N_{\mathrm{RB}-\text { set,UL }}^{\mathrm{BWP}}+1\right)}{2}\right)\right\rceil \quad$ where $\quad N_{\mathrm{RB}-\text { set,UL }}^{\mathrm{BWP}} \quad$ is the number of RB sets contained in the active UL BWP as defined in clause 7 of [6, TS38.214]. If the DCI $0 \_0$ is monitored in a common search space $\mathrm{Y}=0$.

- Time domain resource assignment - 4 bits as defined in Clause 6.1.2.1 of [6, TS 38.214]
- Frequency hopping flag - 1 bit according to Table 7.3.1.1.1-3, as defined in Clause 6.3 of [6, TS 38.214]
- Modulation and coding scheme - 5 bits as defined in Clause 6.1.4.1 of [6, TS 38.214]
- New data indicator - 1 bit
- Redundancy version - 2 bits as defined in Table 7.3.1.1.1-2
- HARQ process number -4 bits
- TPC command for scheduled PUSCH - 2 bits as defined in Clause 7.1.1 of [5, TS 38.213]
- ChannelAccess-CPext - 2 bits indicating combinations of channel access type and CP extension as defined in Table 7.3.1.1.1-4 for operation in a cell with shared spectrum channel access; 0 bit otherwise.
- Padding bits, if required.
- UL/SUL indicator - 1 bit for UEs configured with supplementaryUplink in ServingCellConfig in the cell as defined in Table 7.3.1.1.1-1 and the number of bits for DCI format $1 \_0$ before padding is larger than the number of bits for DCI format $0 \_0$ before padding; 0 bit otherwise. The UL/SUL indicator, if present, locates in the last bit position of DCI format $0 \_0$, after the padding bit(s).
- If the UL/SUL indicator is present in DCI format $0 \_0$ and the higher layer parameter pusch-Config is not configured on both UL and SUL the UE ignores the UL/SUL indicator field in DCI format 0_0, and the corresponding PUSCH scheduled by the DCI format $0 \_0$ is for the UL or SUL for which high layer parameter pucch-Config is configured;
- If the UL/SUL indicator is not present in DCI format $0 \_0$ and pucch-Config is configured, the corresponding PUSCH scheduled by the DCI format $0 \_0$ is for the UL or SUL for which high layer parameter pucch-Config is configured.
- If the UL/SUL indicator is not present in DCI format 0_0 and pucch-Config is not configured, the corresponding PUSCH scheduled by the DCI format $0 \_0$ is for the uplink on which the latest PRACH is transmitted.

The following information is transmitted by means of the DCI format $0 \_0$ with CRC scrambled by TC-RNTI:

- Identifier for DCI formats - 1 bit
- The value of this bit field is always set to 0 , indicating an UL DCI format
- Frequency domain resource assignment - number of bits determined by the following:
- $\quad\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil$ bits if the higher layer parameter useInterlacePUCCH-PUSCH in BWP-

UplinkCommon is not configured, where

- $\quad N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}} \quad$ is the size of the initial UL bandwidth part.
- For PUSCH hopping with resource allocation type 1:
- $\quad N_{\text {UL_hop }} \quad$ MSB bits are used to indicate the frequency offset according to Table 8.3-1 in Clause 8.3 of [5, TS 38.213], where $N_{\text {UL_hop }}=1$ if $N_{\text {RB }}^{\mathrm{UL}, \mathrm{BWP}}<50$ and $N_{\text {UL_hop }}=2$ otherwise

$$
\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil-N_{\mathrm{UL} L \text { hop }} \quad \text { bits provides the frequency domain resource allocation }
$$ according to Clause 6.1.2.2.2 of [6, TS 38.214]

- For non-PUSCH hopping with resource allocation type 1:
- $\quad\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil$ bits provides the frequency domain resource allocation according to Clause 6.1.2.2.2 of [6, TS 38.214]
- if the higher layer parameter useInterlacePUCCH-PUSCH in BWP-UplinkCommon is configured
- 5 bits provide the frequency domain resource allocation according to Clause 6.1.2.2.3 of [6, TS 38.214] if the subcarrier spacing for the active UL bandwidth part is 30 kHz
- 6 bits provide the frequency domain resource allocation according to Clause 6.1.2.2.3 of [6, TS 38.214] if the subcarrier spacing for the active UL bandwidth part is 15 kHz
- Time domain resource assignment - 4 bits as defined in Clause 6.1.2.1 of [6, TS 38.214]
- Frequency hopping flag - 1 bit according to Table 7.3.1.1.1-3, as defined in Clause 6.3 of [6, TS 38.214]
- Modulation and coding scheme - 5 bits as defined in Clause 6.1.4.1 of [6, TS 38.214]
- New data indicator - 1 bit, reserved
- Redundancy version - 2 bits as defined in Table 7.3.1.1.1-2
- HARQ process number -4 bits, reserved
- TPC command for scheduled PUSCH - 2 bits as defined in Clause 7.1.1 of [5, TS 38.213]
- ChannelAccess-CPext - 2 bits indicating combinations of channel access type and CP extension as defined in Table 7.3.1.1.1-4 for operation in a cell with shared spectrum channel access; 0 bit otherwise
- Padding bits, if required.
- UL/SUL indicator - 1 bit if the cell has two ULs and the number of bits for DCI format $1 \_0$ before padding is larger than the number of bits for DCI format $0 \_0$ before padding; 0 bit otherwise. The UL/SUL indicator, if present, locates in the last bit position of DCI format 0_0, after the padding bit(s).
- If 1 bit, reserved, and the corresponding PUSCH is always on the same UL carrier as the previous transmission of the same TB

### 7.3.1.1.2 Format 0_1

DCI format $0 \_1$ is used for the scheduling of one or multiple PUSCH in one cell, or indicating CG downlink feedback information (CG-DFI) to a UE.

The following information is transmitted by means of the DCI format $0 \_1$ with CRC scrambled by C-RNTI or CSRNTI or SP-CSI-RNTI or MCS-C-RNTI:

- Identifier for DCI formats - 1 bit
- The value of this bit field is always set to 0 , indicating an UL DCI format
- Carrier indicator - 0 or 3 bits, as defined in Clause 10.1 of [5, TS38.213].
- DFI flag - 0 or 1 bit
- 1 bit if the UE is configured to monitor DCI format $0 \_1$ with CRC scrambled by CS-RNTI and for operation in a cell with shared spectrum channel access. For a DCI format $0 \_1$ with CRC scrambled by CS-RNTI, the bit value of 0 indicates activating type 2 CG transmission and the bit value of 1 indicates CG-DFI. For a DCI format $0 \_1$ with CRC scrambled by C-RNTI/SP-CSI-RNTI/MCS-C-RNTI and for operation in a cell with shared specrum channel access, the bit is reserved.
- 0 bit otherwise;

If DCI format $0 \_1$ is used for indicating CG-DFI, all the remaining fields are set as follows:

- HARQ-ACK bitmap - 16 bits, where the order of the bitmap to HARQ process index mapping is such that HARQ process indices are mapped in ascending order from MSB to LSB of the bitmap. For each bit of the bitmap, value 1 indicates ACK, and value 0 indicates NACK.
- TPC command for scheduled PUSCH - 2 bits as defined in Clause 7.1.1 of [5, TS38.213]
- All the remaining bits in format $0 \_1$ are set to zero.

Otherwise, all the remaining fields are set as follows:

- UL/SUL indicator - 0 bit for UEs not configured with supplementaryUplink in ServingCellConfig in the cell or UEs configured with supplementaryUplink in ServingCellConfig in the cell but only one carrier in the cell is configured for PUSCH transmission; otherwise, 1 bit as defined in Table 7.3.1.1.1-1.
- Bandwidth part indicator -0 , 1 or 2 bits as determined by the number of UL BWPs $n_{\text {BWP,RRC }}$ configured by higher layers, excluding the initial UL bandwidth part. The bitwidth for this field is determined as $\left\lceil\log _{2}\left(n_{\text {BWP }}\right)\right\rceil$ bits, where
- $\quad n_{B W P}=n_{B W P, R R C}+1$ if $n_{\text {BWP,RRC }}$, in which case the bandwidth part indicator is equivalent to the ascending order of the higher layer parameter BWP-Id;
- otherwise $n_{B W P}=n_{B W P, R R C}$, in which case the bandwidth part indicator is defined in Table 7.3.1.1.2-1;

If a UE does not support active BWP change via DCI, the UE ignores this bit field.

- Frequency domain resource assignment - number of bits determined by the following, where $N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}$ is the size of the active UL bandwidth part:
- If higher layer parameter useInterlacePUCCH-PUSCH in BWP-UplinkDedicated is not configured
- $\quad N_{\text {RBG }}$ bits if only resource allocation type 0 is configured, where $\quad N_{\text {RBG }}$ is defined in Clause 6.1.2.2.1 of [6, TS 38.214],
- $\quad\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil$ bits if only resource allocation type 1 is configured, or
$\max \left(\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil, N_{\mathrm{RBG}}\right)+1 \quad$ bits if resourceAllocation is configured as 'dynamicSwitch'.
- If resourceAllocation is configured as 'dynamicSwitch', the MSB bit is used to indicate resource allocation type 0 or resource allocation type 1 , where the bit value of 0 indicates resource allocation type 0 and the bit value of 1 indicates resource allocation type 1 .
- For resource allocation type 0, the $\quad N_{\text {RBG }} \quad$ LSBs provide the resource allocation as defined in Clause 6.1.2.2.1 of [6, TS 38.214].
- For resource allocation type 1, the $\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil \quad$ LSBs provide the resource allocation as follows:
- For PUSCH hopping with resource allocation type 1:
- $\quad N_{\text {UL_hop }} \quad$ MSB bits are used to indicate the frequency offset according to Clause 6.3 of [6, TS 38.214], where $N_{\text {UL_hop }}=1$ if the higher layer parameter frequencyHoppingOffsetLists contains two offset values and $\quad N_{\text {UL_hop }}=2$ if the higher layer parameter frequencyHoppingOffsetLists contains four offset values
- $\quad\left[\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}+1\right) / 2\right)\right]-N_{\mathrm{UL} \text { _hop }} \quad$ bits provides the frequency domain resource allocation according to Clause 6.1.2.2.2 of [6, TS 38.214]
- For non-PUSCH hopping with resource allocation type 1:
- $\quad\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{UL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil$ bits provides the frequency domain resource allocation according to Clause 6.1.2.2.2 of [6, TS 38.214]
- If the higher layer parameter useInterlacePUCCH-PUSCH in BWP-UplinkDedicated is configured
- $5+\mathrm{Y}$ bits provide the frequency domain resource allocation according to Clause 6.1.2.2.3 of [6, TS 38.214] if the subcarrier spacing for the active UL bandwidth part is 30 kHz . The 5 MSBs provide the interlace allocation and the Y LSBs provide the RB set allocation.
- $6+$ Y bits provide the frequency domain resource allocation according to Clause 6.1.2.2.3 of [6, TS 38.214] if the subcarrier spacing for the active UL bandwidth part is 15 kHz . The 6 MSBs provide the interlace allocation and the Y LSBs provide the RB set allocation.

The value of Y is determined by $\left.\quad \Gamma \log _{2}\left(\frac{N_{R B-\text { set }, U L}^{B W P}\left(N_{R B-\text { set }, U L}^{B W P}+1\right)}{2}\right)\right] \quad$ where $\quad N_{\mathrm{RB}-\mathrm{set}, \mathrm{UL}}^{\mathrm{BWP}} \quad$ is the number of RB sets contained in the active UL BWP as defined in clause 7 of [6, TS38.214].

If "Bandwidth part indicator" field indicates a bandwidth part other than the active bandwidth part and if resourceAllocation is configured as 'dynamicSwitch' for the indicated bandwidth part, the UE assumes resource allocation type 0 for the indicated bandwidth part if the bitwidth of the "Frequency domain resource assignment" field of the active bandwidth part is smaller than the bitwidth of the "Frequency domain resource assignment" field of the indicated bandwidth part.

- Time domain resource assignment $-0,1,2,3,4,5$, or 6 bits
- If the higher layer parameter pusch-TimeDomainAllocationListDCI-0-1 is not configured and if the higher layer parameter pusch-TimeDomainAllocationListForMultiPUSCH is not configured and if the higher layer parameter pusch-TimeDomainAllocationList is configured, $0,1,2,3$, or 4 bits as defined in Clause 6.1.2.1 of [6, TS38.214]. The bitwidth for this field is determined as $\left\lceil\log _{2}(I)\right\rceil$ bits, where $I$ is the number of entries in the higher layer parameter pusch-TimeDomainAllocationList;
- If the higher layer parameter pusch-TimeDomainAllocationListDCI-0-1 is configured or if the higher layer parameter pusch-TimeDomainAllocationListForMultiPUSCH is configured, $0,1,2,3,4,5$ or 6 bits as defined in Clause 6.1.2.1 of [6, TS38.214]. The bitwidth for this field is determined as $\left\lceil\log _{2}(I)\right\rceil$ bits, where $I$ is the number of entries in the higher layer parameter pusch-TimeDomainAllocationListDCI-0-1 or pusch-TimeDomainAllocationListForMultiPUSCH;
- otherwise the bitwidth for this field is determined as $\left\lceil\log _{2}(I)\right\rceil$ bits, where $I$ is the number of entries in the default table.
- Frequency hopping flag - 0 or 1 bit:
- 0 bit if only resource allocation type 0 is configured, or if the higher layer parameter frequencyHopping is not configured and the higher layer parameter pusch-RepTypeIndicatorDCI-0-1 is not configured to puschRepTypeB, or if the higher layer parameter frequencyHoppingDCI-0-1 is not configured and pusch-RepTypeIndicatorDCI-0-1 is configured to pusch-RepTypeB, or if only resource allocation type 2 is configured;
- 1 bit according to Table 7.3.1.1.1-3 otherwise, only applicable to resource allocation type 1 , as defined in Clause 6.3 of [6, TS 38.214].
- Modulation and coding scheme - 5 bits as defined in Clause 6.1.4.1 of [6, TS 38.214]
- New data indicator - 1 bit if the number of scheduled PUSCH indicated by the Time domain resource assignment field is 1 ; otherwise $2,3,4,5,6,7$ or 8 bits determined based on the maximum number of schedulable PUSCH among all entries in the higher layer parameter pusch-
TimeDomainAllocationListForMultiPUSCH, where each bit corresponds to one scheduled PUSCH as defined in clause 6.1.4 in [6, TS 38.214].
- Redundancy version - - number of bits determined by the following:
- $\quad 2$ bits as defined in Table 7.3.1.1.1-2 if the number of scheduled PUSCH indicated by the Time domain resource assignment field is 1 ;
- otherwise 2, 3, 4, 5, 6, 7 or 8 bits determined by the maximum number of schedulable PUSCHs among all entries in the higher layer parameter pusch-TimeDomainAllocationListForMultiPUSCH, where each bit corresponds to one scheduled PUSCH as defined in clause 6.1.4 in [6, TS 38.214] and redundancy version is determined according to Table 7.3.1.1.2-34.
- HARQ process number - 4 bits
- $1^{\text {st }}$ downlink assignment index $-1,2$ or 4 bits:
- 1 bit for semi-static HARQ-ACK codebook;
- 2 bits for dynamic HARQ-ACK codebook, or for enhanced dynamic HARQ-ACK codebook without UL-TotalDAI-Included configured;
- 4 bits for enhanced dynamic HARQ-ACK codebook and with UL-TotalDAI-Included $=$ true.

When two HARQ-ACK codebooks are configured for the same serving cell and if higher layer parameter priorityIndicatorDCI-0-1 is configured, if the bit width of the $1^{\text {st }}$ downlink assignment index in DCI format $0 \_1$ for one HARQ-ACK codebook is not equal to that of the $1^{\text {st }}$ downlink assignment index in DCI format $0 \_1$ for the other HARQ-ACK codebook, a number of most significant bits with value set to '0' are inserted to smaller $1^{\text {st }}$ downlink assignment index until the bit width of the $1^{\text {st }}$ downlink assignment index in DCI format $0 \_1$ for the two HARQ-ACK codebooks are the same.

- $\quad 2^{\text {nd }}$ downlink assignment index $-0,2$ or 4 bits:
- 2 bits for dynamic HARQ-ACK codebook with two HARQ-ACK sub-codebooks, or for enhanced dynamic HARQ-ACK codebook with two HARQ-ACK sub-codebooks and without UL-TotalDAI-Included configured;
- 4 bits for enhanced dynamic HARQ-ACK codebook with two HARQ-ACK sub-codebooks and with UL-TotalDAI-Included $=$ true;
- 0 bit otherwise.

When two HARQ-ACK codebooks are configured for the same serving cell and if higher layer parameter priorityIndicatorDCI-0-1 is configured, if the bit width of the $2^{\text {nd }}$ downlink assignment index in DCI format $0 \_1$ for one HARQ-ACK codebook is not equal to that of the $2^{\text {nd }}$ downlink assignment index in DCI format $0 \_1$ for the other HARQ-ACK codebook, a number of most significant bits with value set to '0' are inserted to smaller $2^{\text {nd }}$ downlink assignment index until the bit width of the $2^{\text {nd }}$ downlink assignment index in DCI format $0 \_1$ for the two HARQ-ACK codebooks are the same.

- TPC command for scheduled PUSCH - 2 bits as defined in Clause 7.1.1 of [5, TS38.213]
- SRS resource indicator -

$$
\left\lceil\log _{2}\left(\sum_{k=1}^{\min \left(L_{\max }, N_{\mathrm{SRS}}\right)}\binom{N_{\mathrm{SRS}}}{k}\right)\right\rceil
$$

of configured SRS resources in the SRS resource set configured by higher layer parameter srs-
ResourceSetToAddModList, and associated with the higher layer parameter usage of value 'codeBook' or 'nonCodeBook',

$$
\left\lceil\log _{2}\left(\sum_{k=1}^{\left.\min \mid L_{\max }, N_{\mathrm{SRS}}\right\}}\binom{N_{\mathrm{SRS}}}{k}\right)\right\rceil
$$

bits according to Tables 7.3.1.1.2-28/29/30/31 if the higher layer parameter txConfig = nonCodebook, where $\quad N_{\text {SRS }}$ is the number of configured SRS resources in the SRS resource set configured by higher layer parameter srs-ResourceSetToAddModList, and associated with the higher layer parameter usage of value 'nonCodeBook' and

- if UE supports operation with maxMIMO-Layers and the higher layer parameter maxMIMO-Layers of PUSCH-ServingCellConfig of the serving cell is configured, $L_{\text {max }}$ is given by that parameter
- otherwise, $L_{\max }$ is given by the maximum number of layers for PUSCH supported by the UE for the serving cell for non-codebook based operation.
- $\quad\left\lceil\log _{2}\left(N_{\mathrm{SRS}}\right)\right\rceil$ bits according to Tables 7.3.1.1.2-32, 7.3.1.1.2-32A and 7.3.1.1.2-32B if the higher layer parameter txConfig = codebook, where $N_{\text {SRS }}$ is the number of configured SRS resources in the SRS resource set configured by higher layer parameter srs-ResourceSetToAddModList, and associated with the higher layer parameter usage of value 'codeBook'.
- Precoding information and number of layers - number of bits determined by the following:
- 0 bits if the higher layer parameter $t x$ Config = nonCodeBook;
- 0 bits for 1 antenna port and if the higher layer parameter txConfig = codebook;
- 4, 5, or 6 bits according to Table 7.3.1.1.2-2 for 4 antenna ports, if $t x$ Config $=$ codebook, ulFullPowerTransmission is not configured or configured to fullpowerMode2 or configured to fullpower, and according to whether transform precoder is enabled or disabled, and the values of higher layer parameters maxRank, and codebookSubset;
- 4 or 5 bits according to Table 7.3.1.1.2-2A for 4 antenna ports, if $t x$ Config $=$ codebook, ulFullPowerTransmission = fullpowerMode1, maxRank=2, transform precoder is disabled, and according to the values of higher layer parameter codebookSubset;
- 4 or 6 bits according to Table 7.3.1.1.2-2B for 4 antenna ports, if $t x$ Config = codebook, ulFullPowerTransmission = fullpowerMode1, maxRank=3 or 4, transform precoder is disabled, and according to the values of higher layer parameter codebookSubset;
- 2, 4, or 5 bits according to Table 7.3.1.1.2-3 for 4 antenna ports, if $t x$ Config $=$ codebook, ulFullPowerTransmission is not configured or configured to fullpowerMode2 or configured to fullpower, and according to whether transform precoder is enabled or disabled, and the values of higher layer parameters maxRank, and codebookSubset;
- 3 or 4 bits according to Table 7.3.1.1.2-3A for 4 antenna ports, if $t x$ Config = codebook, ulFullPowerTransmission = fullpowerMode1, maxRank=1, and according to whether transform precoder is enabled or disabled, and the values of higher layer parameter codebookSubset;
- 2 or 4 bits according to Table7.3.1.1.2-4 for 2 antenna ports, if $t x$ Config = codebook, ulFullPowerTransmission is not configured or configured to fullpowerMode2 or configured to fullpower, and according to whether transform precoder is enabled or disabled, and the values of higher layer parameters maxRank and codebookSubset;
- 2 bits according to Table 7.3.1.1.2-4A for 2 antenna ports, if $t x$ Config $=$ codebook, ulFullPowerTransmission = fullpowerMode1, transform precoder is disabled, maxRank=2, and codebookSubset=nonCoherent;
- 1 or 3 bits according to Table7.3.1.1.2-5 for 2 antenna ports, if $t x$ Config = codebook, ulFullPowerTransmission is not configured or configured to fullpowerMode2 or configured to fullpower, and according to whether transform precoder is enabled or disabled, and the values of higher layer parameters maxRank and codebookSubset;
- 2 bits according to Table 7.3.1.1.2-5A for 2 antenna ports, if $t x$ Config $=$ codebook, ulFullPowerTransmission = fullpowerMode1, maxRank=1, and according to whether transform precoder is enabled or disabled, and the values of higher layer parameter codebookSubset;

For the higher layer parameter txConfig=codebook, if ul-FullPowerTransmission is configured to fullpowerMode2, maxRank is configured to be larger than 2, and at least one SRS resource with 4 antenna ports is configured in an SRS resource set with usage set to 'codebook' and an SRS resource with 2 antenna ports is indicated via SRI in the same SRS resource set, then Table 7.3.1.1.2-4 is used.

For the higher layer parameter txConfig = codebook, if different SRS resources with different number of antenna ports are configured, the bitwidth is determined according to the maximum number of ports in an SRS resource among the configured SRS resources in an SRS resource set with usage set to 'codebook'. If the number of ports for a configured SRS resource in the set is less than the maximum number of ports in an SRS resource among the configured SRS resources, a number of most significant bits with value set to '0' are inserted to the field.

- Antenna ports - number of bits determined by the following
- $\quad 2$ bits as defined by Tables 7.3.1.1.2-6, if transform precoder is enabled, dmrs-Type=1, and maxLength=1, except that dmrs-UplinkTransformPrecoding and tp-pi2BPSK are both configured and $\pi / 2$ BPSK modulation is used;
- 2 bits as defined by Tables 7.3.1.1.2-6A, if transform precoder is enabled and dmrs-

UplinkTransformPrecoding and tp-pi2BPSK are both configured, $\pi / 2$ BPSK modulation is used, dmrsType $=1$, and maxLength $=1$, where $\mathrm{n}_{\text {SCID }}$ is the scrambling identity for antenna ports defined in [Clause 6.4.1.1.1.2, TS38.211];

- 4 bits as defined by Tables 7.3.1.1.2-7, if transform precoder is enabled, dmrs-Type=1, and maxLength=2, except that dmrs-UplinkTransformPrecoding and tp-pi2BPSK are both configured and $\pi / 2$ BPSK modulation is used;
- 4 bits as defined by Tables 7.3.1.1.2-7A, if transform precoder is enabled and dmrsUplinkTransformPrecoding and tp-pi2BPSK are both configured, $\pi / 2$ BPSK modulation is used, dmrsType $=1$, and maxLength $=2$, where $\mathrm{n}_{\text {SCID }}$ is the scrambling identity for antenna ports defined in [Clause 6.4.1.1.1.2, TS38.211];
- 3 bits as defined by Tables 7.3.1.1.2-8/9/10/11, if transform precoder is disabled, dmrs-Type=1, and maxLength $=1$, and the value of rank is determined according to the SRS resource indicator field if the higher layer parameter txConfig = nonCodebook and according to the Precoding information and number of layers field if the higher layer parameter txConfig = codebook;
- 4 bits as defined by Tables 7.3.1.1.2-12/13/14/15, if transform precoder is disabled, dmrs-Type=1, and maxLength $=2$, and the value of rank is determined according to the SRS resource indicator field if the higher layer parameter txConfig = nonCodebook and according to the Precoding information and number of layers field if the higher layer parameter $t x$ Config = codebook;
- 4 bits as defined by Tables 7.3.1.1.2-16/17/18/19, if transform precoder is disabled, dmrs-Type=2, and maxLength $=1$, and the value of rank is determined according to the SRS resource indicator field if the higher layer parameter txConfig = nonCodebook and according to the Precoding information and number of layers field if the higher layer parameter $t x$ Config = codebook;
- 5 bits as defined by Tables 7.3.1.1.2-20/21/22/23, if transform precoder is disabled, dmrs-Type=2, and maxLength $=2$, and the value of rank is determined according to the SRS resource indicator field if the higher layer parameter txConfig = nonCodebook and according to the Precoding information and number of layers field if the higher layer parameter $t x$ Config = codebook.
where the number of CDM groups without data of values 1, 2, and 3 in Tables 7.3.1.1.2-6 to 7.3.1.1.2-23 refers to CDM groups $\{0\},\{0,1\}$, and $\{0,1,2\}$ respectively.

If a UE is configured with both dmrs-UplinkForPUSCH-MappingTypeA and dmrs-UplinkForPUSCHMappingTypeB, the bitwidth of this field equals $\max \left\{x_{A}, x_{B}\right\}$, where $x_{A}$ is the "Antenna ports" bitwidth derived according to dmrs-UplinkForPUSCH-MappingTypeA and ${ }^{X_{B}}$ is the "Antenna ports" bitwidth derived according to dmrs-UplinkForPUSCH-MappingTypeB. A number of $\left|x_{A}-x_{B}\right|$ zeros are padded in the MSB of this field, if the mapping type of the PUSCH corresponds to the smaller value of $X_{A}$ and $X_{B}$.

- $\quad$ SRS request - 2 bits as defined by Table 7.3.1.1.2-24 for UEs not configured with supplementaryUplink in ServingCellConfig in the cell; 3 bits for UEs configured with supplementaryUplink in ServingCellConfig in the cell where the first bit is the non-SUL/SUL indicator as defined in Table 7.3.1.1.1-1 and the second and third bits are defined by Table 7.3.1.1.2-24. This bit field may also indicate the associated CSI-RS according to Clause 6.1.1.2 of [6, TS 38.214].
- CSI request $-0,1,2,3,4,5$, or 6 bits determined by higher layer parameter reportTriggerSize.
- CBG transmission information (CBGTI) - 0 bit if higher layer parameter codeBlockGroupTransmission for PUSCH is not configured or if the number of scheduled PUSCH indicated by the Time domain resource assignment field is larger than 1 ; otherwise, $2,4,6$, or 8 bits determined by higher layer parameter maxCodeBlockGroupsPerTransportBlock for PUSCH.
- PTRS-DMRS association - number of bits determined as follows
- 0 bit if PTRS-UplinkConfig is not configured in either dmrs-UplinkForPUSCH-MappingTypeA or dmrs-UplinkForPUSCH-MappingTypeB and transform precoder is disabled, or if transform precoder is enabled, or if maxRank=1;
- 2 bits otherwise, where Table 7.3.1.1.2-25 and 7.3.1.1.2-26 are used to indicate the association between PTRS port(s) and DMRS port(s) when one PT-RS port and two PT-RS ports are configured by maxNrofPorts in PTRS-UplinkConfig respectively, and the DMRS ports are indicated by the Antenna ports field.

If "Bandwidth part indicator" field indicates a bandwidth part other than the active bandwidth part and the "PTRS-DMRS association" field is present for the indicated bandwidth part but not present for the active bandwidth part, the UE assumes the "PTRS-DMRS association" field is not present for the indicated bandwidth part.

- beta_offset indicator - 0 if the higher layer parameter betaOffsets = semiStatic; otherwise 2 bits as defined by Table 9.3-3 in [5, TS 38.213].

When two HARQ-ACK codebooks are configured for the same serving cell and if higher layer parameter priorityIndicatorDCI-0-1 is configured, if the bit width of the beta_offset indicator in DCI format $0 \_1$ for one HARQ-ACK codebook is not equal to that of the beta_offset indicator in DCI format $0 \_1$ for the other HARQACK codebook, a number of most significant bits with value set to ' 0 ' are inserted to smaller beta_offset indicator until the bit width of the beta_offset indicator in DCI format $0 \_1$ for the two HARQ-ACK codebooks are the same.

- DMRS sequence initialization - 0 bit if transform precoder is enabled; 1 bit if transform precoder is disabled.
- UL-SCH indicator - 0 or 1 bit as follows
- 0 bit if the number of scheduled PUSCH indicated by the Time domain resource assignment field is larger than 1;
- 1 bit otherwise. A value of " 1 " indicates UL-SCH shall be transmitted on the PUSCH and a value of " 0 " indicates UL-SCH shall not be transmitted on the PUSCH. Except for DCI format 0_1 with CRC scrambled by SP-CSI-RNTI, a UE is not expected to receive a DCI format $0 \_1$ with UL-SCH indicator of " 0 " and CSI request of all zero(s).
- ChannelAccess-CPext-CAPC - 0, 1, 2, 3, 4, 5 or 6 bits. The bitwidth for this field is determined as $\left\lceil\log _{2}(I)\right\rceil$ bits, where $I$ is the number of entries in the higher layer parameter ul-AccessConfigListDCI-0-1 for operation in a cell with shared spectrum channel access; otherwise 0 bit. One or more entries from Table 7.3.1.1.2-35 are configured by the higher layer parameter ul-AccessConfigListDCI-0-1.
- Open-loop power control parameter set indication - 0 or 1 or 2 bits.
- 0 bit if the higher layer parameter p0-PUSCH-SetList is not configured;
- 1 or 2 bits otherwise,
- 1 bit if SRS resource indicator is present in the DCI format $0 \_1$;
- 1 or 2 bits as determined by higher layer parameter olpc-ParameterSetDCI-0-1 if SRS resource indicator is not present in the DCI format $0 \_1$.
- Priority indicator - 0 bit if higher layer parameter priorityIndicatorDCI-0-1 is not configured; otherwise 1 bit as defined in Clause 9 in [5, TS 38.213].
- Invalid symbol pattern indicator - 0 bit if higher layer parameter invalidSymbolPatternIndicatorDCI-0-1 is not configured; otherwise 1 bit as defined in Clause 6.1.2.1 in [6, TS 38.214].
- Minimum applicable scheduling offset indicator - 0 or 1 bit
- 0 bit if higher layer parameter minimumSchedulingOffsetK2 is not configured;
- 1 bit if higher layer parameter minimumSchedulingOffsetK2 is configured. The 1 bit indication is used to determine the minimum applicable K2 for the active UL BWP and the minimum applicable K0 value for the active DL BWP, if configured respectively, according to Table 7.3.1.1.2-33. If the minimum applicable K0 is indicated, the minimum applicable value of the aperiodic CSI-RS triggering offset for an active DL BWP shall be the same as the minimum applicable K0 value.
- SCell dormancy indication - 0 bit if higher layer parameter dormancyGroupWithinActiveTime is not configured; otherwise 1, 2, 3, 4 or 5 bits bitmap determined according to higher layer parameter dormancyGroupWithinActiveTime, where each bit corresponds to one of the SCell group(s) configured by higher layers parameter dormancyGroupWithinActiveTime, with MSB to LSB of the bitmap corresponding to the first to last configured SCell group. The field is only present when this format is carried by PDCCH on the primary cell within DRX Active Time and the UE is configured with at least two DL BWPs for an SCell.
- Sidelink assignment index $-0,1$ or 2 bits:
- 1 bit if the UE is configured with pdsch-HARQ-ACK-Codebook = semi-static and, in addition, the UE is configured with a SL configured grant type 1 or to monitor DCI format 3_0 with CRC scrambled by SLRNTI or SL-CS-RNTI;
- 2 bits if the UE is configured with pdsch-HARQ-ACK-Codebook = dynamic and, in addition, the UE is configured with a SL configured grant type 1 or to monitor DCI format 3_0 with CRC scrambled by SLRNTI or SL-CS-RNTI;
- 0 bit otherwise.

A UE does not expect that the bit width of a field in DCI format $0 \_1$ with CRC scrambled by CS-RNTI is larger than corresponding bit width of same field in DCI format $0 \_1$ with CRC scrambled by C-RNTI for the same serving cell. If the bit width of a field in the DCI format $0 \_1$ with CRC scrambled by CS-RNTI is not equal to that of the corresponding field in the DCI format $0 \_1$ with CRC scrambled by C-RNTI for the same serving cell, a number of most significant bits with value set to ' 0 ' are inserted to the field in DCI format $0 \_1$ with CRC scrambled by CS-RNTI until the bit width equals that of the corresponding field in the DCI format $0 \_1$ with CRC scrambled by C-RNTI for the same serving cell.

If the number of information bits in DCI format $0 \_1$ scheduling a single PUSCH prior to padding is not equal to the number of information bits in DCI format $0 \_1$ scheduling multiple PUSCHs for the same serving cell, zeros shall be appended to the DCI format 0_1 with smaller size until the payload size is the same for scheduling a single PUSCH and multiple PUSCHs.

Table 7.3.1.1.2-1: Bandwidth part indicator

| Value of BWP indicator field | Bandwidth part |
| :---: | :---: |
| 2 bits |  |
| 00 | Configured BWP with BWP-Id $=2$ |
| 01 | Configured BWP with BWP-Id $=3$ |
| 10 | Configured BWP with BWP-Id $=4$ |
| 11 |  |

Table 7.3.1.1.2-2: Precoding information and number of layers, for 4 antenna ports, if transform precoder is disabled, maxRank $=2$ or 3 or 4, and ul-FullPowerTransmission is not configured or configured to fullpowerMode2 or configured to fullpower

### 7.3.1.1.3 Format 0_2

DCI format $0 \_2$ is used for the scheduling of PUSCH in one cell.
The following information is transmitted by means of the DCI format $0 \_2$ with CRC scrambled by C-RNTI or CSRNTI or SP-CSI-RNTI or MCS-C-RNTI:

- Identifier for DCI formats - 1 bit
- The value of this bit field is always set to 0 , indicating an UL DCI format
- Carrier indicator $-0,1$, 2 or 3 bits determined by higher layer parameter carrierIndicatorSizeDCI-0-2, as defined in Clause 10.1 of [5, TS38.213].
- UL/SUL indicator - 0 bit for UEs not configured with supplementaryUplink in ServingCellConfig in the cell or UEs configured with supplementaryUplink in ServingCellConfig in the cell but only one carrier in the cell is configured for PUSCH transmission; otherwise, 1 bit as defined in Table 7.3.1.1.1-1.
- Bandwidth part indicator -0 , 1 or 2 bits as determined by the number of UL BWPs $n_{B W P, R R C}$ configured by higher layers, excluding the initial UL bandwidth part. The bitwidth for this field is determined as
$\left\lceil\log _{2}\left(n_{B W P}\right)\right\rceil$ bits, where
- $\quad n_{B W P}=n_{B W P, R R C}+1$ if $n_{B W P, R R C} \leq 3$, in which case the bandwidth part indicator is equivalent to the ascending order of the higher layer parameter BWP-Id;
- otherwise $n_{B W P}=n_{B W P, R R C}$, in which case the bandwidth part indicator is defined in Table 7.3.1.1.2-1;

If a UE does not support active BWP change via DCI, the UE ignores this bit field.

- Frequency domain resource assignment - number of bits determined by the following:
- $\quad N_{R B G}$ bits if only resource allocation type 0 is configured, where $N_{R B G}$ is defined in Clause 6.1.2.2.1 of [6, TS 38.214]
- $\quad\left\lceil\log _{2}\left(N_{R B G, K 1}\left(N_{R B G, K 1}+1\right) / 2\right)\right\rceil$ bits if only resource allocation type 1 is configured, or $\left.\max \left(\Gamma \log _{2}\left(N_{R B G, K 1}\left(N_{R B G, K 1}+1\right) / 2\right)\right\rceil, N_{\text {RBG }}\right)+1$ bits if resourceAllocationDCI-0-2-r16 is configured as 'dynamicSwitch', where $\left.\quad N_{R B G, K 1}=\Gamma\left(N_{R B}^{U L, B W P}+\left(N_{U L, B W P}^{\text {start }} \bmod K 1\right)\right) / K 1\right\rceil$,
$N_{R B}^{U L, B W P} \quad$ is the size of the active UL bandwidth part, $\quad N_{U L, B W P}^{\text {start }} \quad$ is defined as in clause 4.4.4.4 of [4, TS 38.211] and $K 1$ is given by higher layer parameter resourceAllocationType1GranularityDCI-0-2. If the higher layer parameter resourceAllocationType1GranularityDCI-0-2 is not configured, K 1 is equal to 1 .
- If resourceAllocationDCI-0-2-r16 is configured as 'dynamicSwitch', the MSB bit is used to indicate resource allocation type 0 or resource allocation type 1 , where the bit value of 0 indicates resource allocation type 0 and the bit value of 1 indicates resource allocation type 1.
- For resource allocation type 0 , the $\quad N_{\text {RBG }} \quad$ LSBs provide the resource allocation as defined in Clause 6.1.2.2.1 of [6, TS 38.214].
- For resource allocation type 1, the $\quad\left\lceil\log _{2}\left(N_{R B G, K 1}\left(N_{R B G, K 1}+1\right) / 2\right)\right\rceil \quad$ LSBs provide the resource allocation as follows:
- For PUSCH hopping with resource allocation type 1:
- $\quad N_{U L_{\text {hop }}}$ MSB bits are used to indicate the frequency offset according to Clause 6.3 of [6, TS 38.214], where $\quad N_{U L_{\text {bop }}}=1$ if the higher layer parameter frequencyHoppingOffsetListsDCI-0-2 contains two offset values and $\quad N_{U L_{\text {hop }}}=2$ if the higher layer parameter frequencyHoppingOffsetListsDCI-0-2 contains four offset values
- $\quad\left[\log _{2}\left(N_{R B G, K 1}\left(N_{R B G, K 1}+1\right) / 2\right)\right]-N_{U L_{\text {hop }}}$ bits provides the frequency domain resource allocation according to Clause 6.1.2.2.2 of [6, TS 38.214]
- For non-PUSCH hopping with resource allocation type 1:
- $\quad\left\lceil\log _{2}\left(N_{R B G, K 1}\left(N_{R B G, K 1}+1\right) / 2\right)\right\rceil$ bits provides the frequency domain resource allocation according to Clause 6.1.2.2.2 of [6, TS 38.214]

If "Bandwidth part indicator" field indicates a bandwidth part other than the active bandwidth part and if resourceAllocationDCI-0-2-r16 is configured as 'dynamicSwitch' for the indicated bandwidth part, the UE assumes resource allocation type 0 for the indicated bandwidth part if the bitwidth of the "Frequency domain resource assignment" field of the active bandwidth part is smaller than the bitwidth of the "Frequency domain resource assignment" field of the indicated bandwidth part.

- Time domain resource assignment $-0,1,2,3,4,5$ or 6 bits as defined in Clause 6.1.2.1 of [6, TS38.214]. The bitwidth for this field is determined as $\left\lceil\log _{2}(I)\right\rceil$ bits, where $I$ is the number of entries in the higher layer
parameter pusch-TimeDomainAllocationListDCI-0-2 if the higher layer parameter is configured, or $I$ is the number of entries in the higher layer parameter PUSCH-TimeDomainResourceAllocationList if the higher layer parameter PUSCH-TimeDomainResourceAllocationList is configured and the higher layer parameter pusch-TimeDomainAllocationListDCI-0-2 is not configured; otherwise $I$ is the number of entries in the default table.
- Frequency hopping flag - 0 or 1 bit:
- 0 bit if the higher layer parameter frequencyHoppingDCI-0-2 is not configured;
- 1 bit according to Table 7.3.1.1.1-3 otherwise, only applicable to resource allocation type 1, as defined in Clause 6.3 of [6, TS 38.214].
- Modulation and coding scheme -5 bits as defined in Clause 6.1.4.1 of [6, TS 38.214]
- New data indicator -1 bit
- Redundancy version -0 , 1 or 2 bits determined by higher layer parameter numberOfBitsForRV-DCI-0-2
- If 0 bit is configured, $r v_{i d}$ to be applied is 0 ;
- 1 bit according to Table 7.3.1.2.3-1;
- 2 bits according to Table 7.3.1.1.1-2.
- HARQ process number $-0,1,2,3$ or 4 bits determined by higher layer parameter harq-ProcessNumberSizeDCI-0-2
- Downlink assignment index - 0, 1, 2 or 4 bits
- 0 bit if the higher layer parameter downlinkAssignmentIndexDCI-0-2 is not configured;
- 1, 2 or 4 bits otherwise,
- $1^{\text {st }}$ downlink assignment index -1 or 2 bits:
- 1 bit for semi-static HARQ-ACK codebook;
- 2 bits for dynamic HARQ-ACK codebook.
- $2^{\text {nd }}$ downlink assignment index -0 or 2 bits
- 2 bits for dynamic HARQ-ACK codebook with two HARQ-ACK sub-codebooks;
- 0 bit otherwise.

When two HARQ-ACK codebooks are configured for the same serving cell and if higher layer parameter priorityIndicatorDCI-0-2 is configured, if the bit width of the Downlink assignment index in DCI format $0 \_2$ for one HARQ-ACK codebook is not equal to that of the Downlink assignment index in DCI format $0 \_2$ for the other HARQ-ACK codebook, a number of most significant bits with value set to ' 0 ' are inserted to smaller Downlink assignment index until the bit width of the Downlink assignment index in DCI format $0 \_2$ for the two HARQ-ACK codebooks are the same.

- TPC command for scheduled PUSCH - 2 bits as defined in Clause 7.1.1 of [5, TS38.213]

$$
\left\lceil\log _{2}\left(\sum_{k=1}^{\min \left(L_{\max }, N_{\mathrm{SRS}}\right)}\binom{N_{\mathrm{SRS}}}{k}\right)\right\rceil_{\text {or }}\left\lceil\log _{2} N_{\text {SRS }}\right\rceil{ }_{\text {bits, where }} N_{\text {SRS }} \quad \text { is the }
$$

- SRS resource indicator number of configured SRS resources in the SRS resource set configured by higher layer parameter srs-ResourceSetToAddModListDCI-0-2, and associated with the higher layer parameter usage of value 'codeBook' or 'nonCodeBook',
$\left\lceil\log _{2}\left(\sum_{k=1}^{\min \left(L_{\max }, N_{\mathrm{SRS}}\right\}}\binom{N_{\mathrm{SRS}}}{k}\right)\right\rceil$
bits according to Tables 7.3.1.1.2-28/29/30/31 if the higher layer parameter $t x$ Config $=$ nonCodebook, where $\quad N_{S R S} \quad$ is the number of configured SRS resources in the SRS resource
set configured by higher layer parameter srs-ResourceSetToAddModListDCI-0-2, and associated with the higher layer parameter usage of value 'nonCodeBook' and
- if UE supports operation with maxMIMO-LayersDCI-0-2 and the higher layer parameter maxMIMO-LayersDCI-0-2 of PUSCH-ServingCellConfig of the serving cell is configured, $L_{\text {max }}$ is given by that parameter
- otherwise, $L_{\max }$ is given by the maximum number of layers for PUSCH supported by the UE for the serving cell for non-codebook based operation.
- $\quad\left\lceil\log _{2} N_{S R S}\right\rceil$ bits according to Tables 7.3.1.1.2-32 if the higher layer parameter txConfig = codebook, where $\quad N_{S R S}$ is the number of configured SRS resources in the SRS resource set configured by higher layer parameter srs-ResourceSetToAddModListDCI-0-2, and associated with the higher layer parameter usage of value 'codeBook'.
- Precoding information and number of layers - number of bits determined by the following:
- 0 bits if the higher layer parameter $t x$ Config = nonCodeBook;
- 0 bits for 1 antenna port and if the higher layer parameter txConfig = codebook;
- 4, 5, or 6 bits according to Table 7.3.1.1.2-2 for 4 antenna ports, if txConfig $=$ codebook, ulFullPowerTransmission is not configured or configured to fullpowerMode2 or configured to fullpower, and according to whether transform precoder is enabled or disabled, and the values of higher layer parameters maxRankDCI-0-2, and codebookSubsetDCI-0-2;
- 4 or 5 bits according to Table 7.3.1.1.2-2A for 4 antenna ports, if $t x C o n f i g=$ codebook, ulFullPowerTransmission =fullpowerMode1, the values of higher layer parameters maxRankDCI-0-2=2, transform precoder is disabled, and according to the value of higher layer parameter codebookSubsetDCI-0-2;
- 4 or 6 bits according to Table 7.3.1.1.2-2B for 4 antenna ports, if $t x$ Config = codebook, ulFullPowerTransmission =fullpowerMode1, the values of higher layer parameters maxRankDCI-0-2=3 or 4, transform precoder is disabled, and according to the value of higher layer parameter codebookSubsetDCI-0-2;
- 2, 4, or 5 bits according to Table 7.3.1.1.2-3 for 4 antenna ports, if txConfig = codebook, ulFullPowerTransmission is not configured or configured to fullpowerMode2 or configured to fullpower, and according to whether transform precoder is enabled or disabled, and the values of higher layer parameters maxRankDCI-0-2 and codebookSubsetDCI-0-2;
- 3 or 4 bits according to Table 7.3.1.1.2-3A for 4 antenna ports, if $t x C o n f i g=c o d e b o o k, ~ u l-~$ FullPowerTransmission =fullpowerMode1, maxRankDCI-0-2=1, and according to whether transform precoder is enabled or disabled, and the value of higher layer parameter codebookSubsetDCI-0-2;
- 2 or 4 bits according to Table7.3.1.1.2-4 for 2 antenna ports, if $t x$ Config = codebook, ulFullPowerTransmission is not configured or configured to fullpowerMode2 or configured to fullpower, and according to whether transform precoder is enabled or disabled, and the values of higher layer parameters maxRankDCI-0-2 and codebookSubsetDCI-0-2;
- 2 bits according to Table 7.3.1.1.2-4A for 2 antenna ports, if $t x$ Config $=$ codebook, ulFullPowerTransmission =fullpowerMode1, transform precoder is disabled, the maxRankDCI-0-2=2, and codebookSubsetDCI-0-2 = nonCoherent;
- 1 or 3 bits according to Table7.3.1.1.2-5 for 2 antenna ports, if $t x$ Config = codebook, ulFullPowerTransmission is not configured or configured to fullpowerMode2 or configured to fullpower, and according to whether transform precoder is enabled or disabled, and the values of higher layer parameters maxRankDCI-0-2 and codebookSubsetDCI-0-2;
- 2 bits according to Table 7.3.1.1.2-5A for 2 antenna ports, if $t x$ Config $=$ codebook, ulFullPowerTransmission =fullpowerMode1, maxRankDCI-0-2=1, and according to whether transform precoder is enabled or disabled, and the value of higher layer parameter codebookSubsetDCI-0-2.

For the higher layer parameter txConfig=codebook, if ul-FullPowerTransmission is configured to fullpowerMode2, the values of higher layer parameters maxRankDCI-0-2 is configured to be larger than 2 , and at least one SRS
resource with 4 antenna ports is configured in an SRS resource set with usage set to 'codebook' and an SRS resource with 2 antenna ports is indicated via SRI in the same SRS resource set, then Table 7.3.1.1.2-4 is used.

For the higher layer parameter $t x$ Config = codebook, if different SRS resources with different number of antenna ports are configured, the bitwidth is determined according to the maximum number of ports in an SRS resource among the configured SRS resources in an SRS resource set with usage set to 'codebook'. If the number of ports for a configured SRS resource in the set is less than the maximum number of ports in an SRS resource among the configured SRS resources, a number of most significant bits with value set to ' 0 ' are inserted to the field.

- Antenna ports - number of bits determined by the following:
- 0 bit if higher layer parameter antennaPortsFieldPresenceDCI-0-2 is not configured;
- $2,3,4$, or 5 bits otherwise,
- $\quad 2$ bits as defined by Tables 7.3.1.1.2-6, if transform precoder is enabled, dmrs-Type=1, and maxLength=12 except that dmrs-UplinkTransformPrecoding and tp-pi2BPSK are both configured and $\pi / 2$ BPSK modulation is used;
- 2 bits as defined by 7.3.1.1.2-6A, if transform precoder is enabled, and dmrs-UplinkTransformPrecoding and $t p-p i 2 B P S K$ are both configured, $\pi / 2$ BPSK modulation is used, dmrs-Type $=1$, and maxLength=1, where $\mathrm{n}_{\text {SCID }}$ is the scrambling identity for antenna ports defined in Clause 6.4.1.1.1.2, in [4, TS38.211];
- 4 bits as defined by Tables 7.3.1.1.2-7, if transform precoder is enabled, dmrs-Type=1, and maxLength=2, except that dmrs-UplinkTransformPrecoding and tp-pi2BPSK are both configured and $\pi / 2$ BPSK modulation is used;
- 4 bits as defined by Tables 7.3.1.1.2-7A, if transform precoder is enabled, and dmrsUplinkTransformPrecoding and tp-pi2BPSK are both configured, $\pi / 2$ BPSK modulation is used, dmrsType $=1$, and maxLength=2, where $n_{\text {SCID }}$ is the scrambling identity for antenna ports defined in Clause 6.4.1.1.1.2, in [4, TS38.211];
- 3 bits as defined by Tables 7.3.1.1.2-8/9/10/11, if transform precoder is disabled, dmrs-Type=1, and maxLength $=1$, and the value of rank is determined according to the SRS resource indicator field if the higher layer parameter txConfig = nonCodebook and according to the Precoding information and number of layers field if the higher layer parameter txConfig = codebook;
- 4 bits as defined by Tables 7.3.1.1.2-12/13/14/15, if transform precoder is disabled, dmrs-Type=1, and maxLength $=2$, and the value of rank is determined according to the SRS resource indicator field if the higher layer parameter $t x$ Config $=$ nonCodebook and according to the Precoding information and number of layers field if the higher layer parameter txConfig = codebook;
- 4 bits as defined by Tables 7.3.1.1.2-16/17/18/19, if transform precoder is disabled, dmrs-Type=2, and maxLength $=1$, and the value of rank is determined according to the SRS resource indicator field if the higher layer parameter txConfig = nonCodebook and according to the Precoding information and number of layers field if the higher layer parameter txConfig = codebook;
- 5 bits as defined by Tables 7.3.1.1.2-20/21/22/23, if transform precoder is disabled, dmrs-Type=2, and maxLength=2, and the value of rank is determined according to the SRS resource indicator field if the higher layer parameter txConfig = nonCodebook and according to the Precoding information and number of layers field if the higher layer parameter txConfig = codebook.
where the number of CDM groups without data of values 1, 2, and 3 in Tables 7.3.1.1.2-6 to 7.3.1.1.2-23 refers to CDM groups $\{0\},\{0,1\}$, and $\{0,1,2\}$ respectively.

If a UE is configured with both dmrs-UplinkForPUSCH-MappingTypeA-DCI-0-2 and dmrs-UplinkForPUSCH-MappingTypeB-DCI-0-2 and is configured with antennaPortsFieldPresenceDCI-0-2, the bitwidth of this field equals $\max \left\{x_{A}, x_{B}\right\}$, where $x_{A}$ is the "Antenna ports" bitwidth derived according to dmrs-UplinkForPUSCH-MappingTypeA-DCI-0-2 and $\quad x_{B}$ is the "Antenna ports" bitwidth derived according to dmrs-UplinkForPUSCH-MappingTypeB-DCI-0-2. A number of $\left|x_{A}-x_{B}\right|$ zeros are padded in the MSB of this field, if the mapping type of the PUSCH corresponds to the smaller value of $X_{A}$ and $X_{B}$.

If a UE is not configured with higher layer parameter antennaPortsFieldPresenceDCI-0-2, antenna port(s) are defined assuming bit field index value 0 in Tables 7.3.1.1.2-6 to 7.3.1.1.2-23.

- SRS request $-0,1$, 2 or 3 bits
- 0 bit if the higher layer parameter srs-RequestDCI-0-2 is not configured;
- 1 bit as defined by Table 7.3.1.1.3-1 if higher layer parameter srs-RequestDCI-0-2 $=1$ and for UEs not configured with supplementaryUplink in ServingCellConfig in the cell;
- 2 bits if higher layer parameter srs-RequestDCI-0-2 $=1$ and for UEs configured with supplementaryUplink in ServingCellConfig in the cell, where the first bit is the non-SUL/SUL indicator as defined in Table 7.3.1.1.1-1 and the second bit is defined by Table 7.3.1.1.3-1;
- 2 bits as defined by Table 7.3.1.1.2-24 if higher layer parameter srs-RequestDCI-0-2 $=2$ and for UEs not configured with supplementaryUplink in ServingCellConfig in the cell;
- 3 bits if higher layer parameter srs-RequestDCI-0-2 $=2$ and for UEs configured with supplementaryUplink in ServingCellConfig in the cell, where the first bit is the non-SUL/SUL indicator as defined in Table 7.3.1.1.1-1 and the second and third bits are defined by Table 7.3.1.1.2-24;
- CSI request $-0,1,2,3,4,5$, or 6 bits determined by higher layer parameter reportTriggerSizeDCI-0-2.
- PTRS-DMRS association - number of bits determined as follows
- 0 bit if PTRS-UplinkConfig is not configured in either dmrs-UplinkForPUSCH-MappingTypeA or dmrs-UplinkForPUSCH-MappingTypeB and transform precoder is disabled, or if transform precoder is enabled, or if maxRankDCI-0-2=1;
- 2 bits otherwise, where Table 7.3.1.1.2-25 and 7.3.1.1.2-26 are used to indicate the association between PTRS port(s) and DMRS port(s) when one PT-RS port and two PT-RS ports are configured by maxNrofPorts in PTRS-UplinkConfig respectively, and the DMRS ports are indicated by the Antenna ports field.

If "Bandwidth part indicator" field indicates a bandwidth part other than the active bandwidth part and the "PTRS-DMRS association" field is present for the indicated bandwidth part but not present for the active bandwidth part, the UE assumes the "PTRS-DMRS association" field is not present for the indicated bandwidth part.

- beta_offset indicator - 0 bit if the higher layer parameter betaOffsets = semiStatic; otherwise 1 bit if 2 offset indexes are configured by higher layer parameter dynamicDCI-0-2 as defined by Table 9.3-3A in [5, TS 38.213], and 2 bits if 4 offset indexes are configured by higher layer parameter dynamicDCI-0-2 as defined by Table 9.3-3 in [5, TS 38.213].

When two HARQ-ACK codebooks are configured for the same serving cell and if higher layer parameter priorityIndicatorDCI-0-2 is configured, if the bit width of the beta_offset indicator in DCI format $0 \_2$ for one HARQ-ACK codebook is not equal to that of the beta_offset indicator in DCI format $0 \_2$ for the other HARQACK codebook, a number of most significant bits with value set to ' 0 ' are inserted to smaller beta_offset indicator until the bit width of the beta_offset indicator in DCI format $0 \_2$ for the two HARQ-ACK codebooks are the same.

- DMRS sequence initialization -0 or 1 bit
- 0 bit if the higher layer parameter dmrs-SequenceInitializationDCI-0-2 is not configured or if transform precoder is enabled;
- 1 bit if transform precoder is disabled and the higher layer parameter dmrs-SequenceInitializationDCI-0-2 is configured.
- UL-SCH indicator - 1 bit. A value of "1" indicates UL-SCH shall be transmitted on the PUSCH and a value of " 0 " indicates UL-SCH shall not be transmitted on the PUSCH. Except for DCI format 0_2 with CRC scrambled by SP-CSI-RNTI, a UE is not expected to receive a DCI format $0 \_2$ with UL-SCH indicator of " 0 " and CSI request of all zero(s).
- Open-loop power control parameter set indication - 0 or 1 or 2 bits.
- 0 bit if the higher layer parameter p0-PUSCH-SetList is not configured;
- 1 or 2 bits otherwise,
- 1 bit if SRS resource indicator is present in the DCI format $0 \_2$;
- 1 or 2 bits as determined by higher layer parameter olpc-ParameterSetDCI-0-2 if SRS resource indicator is not present in the DCI format $0 \_2$;
- Priority indicator - 0 bit if higher layer parameter priorityIndicatorDCI-0-2 is not configured; otherwise 1 bit as defined in Clause 9 in [5, TS 38.213].
- Invalid symbol pattern indicator - 0 bit if higher layer parameter invalidSymbolPatternIndicatorDCI-0-2 is not configured; otherwise 1 bit as defined in Clause 6.1.2.1 in [6, TS 38.214].

A UE does not expect that the bit width of a field in DCI format $0 \_2$ with CRC scrambled by CS-RNTI is larger than corresponding bit width of same field in DCI format $0 \_2$ with CRC scrambled by C-RNTI for the same serving cell. If the bit width of a field in the DCI format $0 \_2$ with CRC scrambled by CS-RNTI is not equal to that of the corresponding field in the DCI format $0 \_2$ with CRC scrambled by C-RNTI for the same serving cell, a number of most significant bits with value set to ' 0 ' are inserted to the field in DCI format $0 \_2$ with CRC scrambled by CS-RNTI until the bit width equals that of the corresponding field in the DCI format $0 \_2$ with CRC scrambled by C-RNTI for the same serving cell.

Table 7.3.1.1.3-1: 1 bit SRS request in DCI format $0 \_2$ and DCI format 1_2

| Value of SRS request <br> field | Triggered aperiodic SRS resource <br> set(s) for DCI format 0_2 and 1_2 |
| :---: | :--- |
| 0 | No aperiodic SRS resource set <br> triggered |
| 1 | SRS resource set(s) configured with <br> higher layer parameter aperiodicSRS- <br> ResourceTrigger set to 1 or an entry in <br> aperiodicSRS-ResourceTriggerList set <br> to 1 |

### 7.3.1.2 $\quad \mathrm{DCI}$ formats for scheduling of PDSCH

### 7.3.1.2.1 Format 1_0

DCI format $1 \_0$ is used for the scheduling of PDSCH in one DL cell.
The following information is transmitted by means of the DCI format $1 \_0$ with CRC scrambled by C-RNTI or CSRNTI or MCS-C-RNTI:

- Identifier for DCI formats - 1 bits
- The value of this bit field is always set to 1 , indicating a DL DCI format
- Frequency domain resource assignment - $\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil$ bits where $N_{\mathrm{RB}}^{\mathrm{DLLBWP}}$ is given by clause 7.3.1.0

If the CRC of the DCI format $1 \_0$ is scrambled by C-RNTI and the "Frequency domain resource assignment" field are of all ones, the DCI format $1 \_0$ is for random access procedure initiated by a PDCCH order, with all remaining fields set as follows:

- Random Access Preamble index - 6 bits according to ra-PreambleIndex in Clause 5.1.2 of [8, TS38.321]
- UL/SUL indicator - 1 bit. If the value of the "Random Access Preamble index" is not all zeros and if the UE is configured with supplementaryUplink in ServingCellConfig in the cell, this field indicates which UL carrier in the cell to transmit the PRACH according to Table 7.3.1.1.1-1; otherwise, this field is reserved
- SS/PBCH index - 6 bits. If the value of the "Random Access Preamble index" is not all zeros, this field indicates the SS/PBCH that shall be used to determine the RACH occasion for the PRACH transmission; otherwise, this field is reserved.
- PRACH Mask index - 4 bits. If the value of the "Random Access Preamble index" is not all zeros, this field indicates the RACH occasion associated with the SS/PBCH indicated by "SS/PBCH index" for the PRACH transmission, according to Clause 5.1.1 of [8, TS38.321]; otherwise, this field is reserved
- Reserved bits - 12 bits for operation in a cell with shared spectrum channel access; otherwise 10 bits

Otherwise, all remaining fields are set as follows:

- Time domain resource assignment - 4 bits as defined in Clause 5.1.2.1 of [6, TS 38.214]
- VRB-to-PRB mapping - 1 bit according to Table 7.3.1.2.2-5
- Modulation and coding scheme - 5 bits as defined in Clause 5.1.3 of [6, TS 38.214]
- New data indicator - 1 bit
- Redundancy version - 2 bits as defined in Table 7.3.1.1.1-2
- HARQ process number - 4 bits
- Downlink assignment index - 2 bits as defined in Clause 9.1.3 of [5, TS 38.213], as counter DAI
- TPC command for scheduled PUCCH - 2 bits as defined in Clause 7.2.1 of [5, TS 38.213]
- PUCCH resource indicator - 3 bits as defined in Clause 9.2.3 of [5, TS 38.213]
- PDSCH-to-HARQ_feedback timing indicator - 3 bits as defined in Clause 9.2.3 of [5, TS38.213]
- ChannelAccess-CPext - 2 bits indicating combinations of channel access type and CP extension as defined in Table 7.3.1.1.1-4 for operation in a cell with shared spectrum channel access; 0 bits otherwise

The following information is transmitted by means of the DCI format $1 \_0$ with CRC scrambled by P-RNTI:

- $\quad$ Short Messages Indicator - 2 bits according to Table 7.3.1.2.1-1.
- Short Messages - 8 bits, according to Clause 6.5 of [9, TS38.331]. If only the scheduling information for Paging is carried, this bit field is reserved.
- Frequency domain resource assignment - $\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil$ bits. If only the short message is carried, this bit field is reserved.
- $\quad N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}$ is the size of CORESET 0
- Time domain resource assignment - 4 bits as defined in Clause 5.1.2.1 of [6, TS38.214]. If only the short message is carried, this bit field is reserved.
- VRB-to-PRB mapping - 1 bit according to Table 7.3.1.2.2-5. If only the short message is carried, this bit field is reserved.
- Modulation and coding scheme - 5 bits as defined in Clause 5.1.3 of [6, TS38.214], using Table 5.1.3.1-1. If only the short message is carried, this bit field is reserved.
- TB scaling - 2 bits as defined in Clause 5.1.3.2 of [6, TS38.214]. If only the short message is carried, this bit field is reserved.
- Reserved bits - 8 bits for operation in a cell with shared spectrum channel access; otherwise 6 bits

The following information is transmitted by means of the DCI format $1 \_0$ with CRC scrambled by SI-RNTI:

- Frequency domain resource assignment - $\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil$ bits
- $\quad N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}$ is the size of CORESET 0
- Time domain resource assignment - 4 bits as defined in Clause 5.1.2.1 of [6, TS38.214]
- VRB-to-PRB mapping - 1 bit according to Table 7.3.1.2.2-5
- Modulation and coding scheme - 5 bits as defined in Clause 5.1.3 of [6, TS38.214], using Table 5.1.3.1-1
- Redundancy version - 2 bits as defined in Table 7.3.1.1.1-2
- System information indicator - 1 bit as defined in Table 7.3.1.2.1-2
- Reserved bits - 17 bits for operation in a cell with shared spectrum channel access; otherwise 15 bits

The following information is transmitted by means of the DCI format $1 \_0$ with CRC scrambled by RA-RNTI or MsgBRNTI:

- Frequency domain resource assignment - $\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil$ bits
- $\quad N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}$ is the size of CORESET 0 if CORESET 0 is configured for the cell and $N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}$ is the size of initial DL bandwidth part if CORESET 0 is not configured for the cell
- Time domain resource assignment - 4 bits as defined in Clause 5.1.2.1 of [6, TS38.214]
- VRB-to-PRB mapping - 1 bit according to Table 7.3.1.2.2-5
- Modulation and coding scheme - 5 bits as defined in Clause 5.1.3 of [6, TS38.214], using Table 5.1.3.1-1
- TB scaling - 2 bits as defined in Clause 5.1.3.2 of [6, TS38.214]
- LSBs of SFN - 2 bits for the DCI format $1 \_0$ with CRC scrambled by MsgB-RNTI as defined in Clause 8.2A of [5, TS 38.213] if msgB-responseWindow is configured to be larger than 10 ms ; or 2 bits for the DCI format $1 \_0$ with CRC scrambled by RA-RNTI as defined in Clause 8.2 of [5, TS 38.213] for operation in a cell with shared spectrum channel access if ra-ResponseWindow or ra-ResponseWindow-v1610 is configured to be larger than 10 ms; 0 bit otherwise
- Reserved bits - $(16-A)$ bits for operation in a cell without shared spectrum access, $(18-A)$ for operation in a cell with shared spectrum access, where the value of $A$ is the number of bits for the field of 'LSBs of SFN' as defined above

The following information is transmitted by means of the DCI format $1 \_0$ with CRC scrambled by TC-RNTI:

- Identifier for DCI formats - 1 bit
- The value of this bit field is always set to 1 , indicating a DL DCI format
- Frequency domain resource assignment - $\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil$ bits
- $\quad N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}$ is the size of CORESET 0
- Time domain resource assignment - 4 bits as defined in Clause 5.1.2.1 of [6, TS38.214]
- VRB-to-PRB mapping - 1 bit according to Table 7.3.1.2.2-5
- Modulation and coding scheme - 5 bits as defined in Clause 5.1.3 of [6, TS38.214], using Table 5.1.3.1-1
- New data indicator - 1 bit
- Redundancy version - 2 bits as defined in Table 7.3.1.1.1-2
- HARQ process number - 4 bits
- Downlink assignment index - 2 bits, reserved
- TPC command for scheduled PUCCH - 2 bits as defined in Clause 7.2.1 of [5, TS38.213]
- PUCCH resource indicator - 3 bits as defined in Clause 9.2.3 of [5, TS38.213]
- PDSCH-to-HARQ_feedback timing indicator - 3 bits as defined in Clause 9.2.3 of [5, TS38.213]
- ChannelAccess-CPext - 2 bits indicating combinations of channel access type and CP extension as defined in Table 7.3.1.1.1-4 for operation in a cell with shared spectrum channel access; otherwise 0 bit

Table 7.3.1.2.1-1: Short Message indicator

| Bit field | Short Message indicator |
| :---: | :---: |
| 00 | Reserved |
| 01 | Only scheduling information for Paging is present in the DCI |
| 10 | Only short message is present in the DCl |
| 11 | Both scheduling information for Paging and short message are present in the DCI |

Table 7.3.1.2.1-2: System information indicator

| Bit field | System information indicator |
| :---: | :---: |
| 0 | SIB1 [9, TS38.331, Clause 5.2.1] |
| 1 | SI message [9, TS38.331, Clause 5.2.1] |

### 7.3.1.2.2 Format 1_1

DCI format $1 \_1$ is used for the scheduling of PDSCH in one cell.
The following information is transmitted by means of the DCI format $1 \_1$ with CRC scrambled by C-RNTI or CSRNTI or MCS-C-RNTI:

- Identifier for DCI formats - 1 bits
- The value of this bit field is always set to 1 , indicating a DL DCI format
- Carrier indicator -0 or 3 bits as defined in Clause 10.1 of [5, TS 38.213].
- Bandwidth part indicator $-0,1$ or 2 bits as determined by the number of DL BWPs $n_{\text {BWP,RRC }}$ configured by higher layers, excluding the initial DL bandwidth part. The bitwidth for this field is determined as $\left\lceil\log _{2}\left(n_{\mathrm{BWP}}\right)\right\rceil$ bits, where
- $\quad n_{\mathrm{BWP}}=n_{\mathrm{BWP}, \mathrm{RRC}}+1$ if $n_{\mathrm{BWP}, \mathrm{RRC}}$, in which case the bandwidth part indicator is equivalent to the ascending order of the higher layer parameter BWP-Id;
- otherwise $n_{B W P}=n_{B W P, R R C}$, in which case the bandwidth part indicator is defined in Table 7.3.1.1.2-1;

If a UE does not support active BWP change via DCI, the UE ignores this bit field.

- Frequency domain resource assignment - number of bits determined by the following, where $N_{R B}^{\mathrm{DL}, \mathrm{BWP}}$ is the size of the active DL bandwidth part:
- $\quad N_{\text {RBG }} \quad$ bits if only resource allocation type 0 is configured, where $\quad N_{\text {RBG }} \quad$ is defined in Clause 5.1.2.2.1 of [6, TS38.214],
- $\quad\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil$ bits if only resource allocation type 1 is configured, or
- $\quad \max \left(\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil, N_{\mathrm{RBG}}\right)+1 \quad$ bits if resourceAllocation is configured as 'dynamicSwitch'.
- If resourceAllocation is configured as 'dynamicSwitch', the MSB bit is used to indicate resource allocation type 0 or resource allocation type 1 , where the bit value of 0 indicates resource allocation type 0 and the bit value of 1 indicates resource allocation type 1.
- For resource allocation type 0 , the $N_{\text {RBG }}$ LSBs provide the resource allocation as defined in Clause 5.1.2.2.1 of [6, TS 38.214].
- For resource allocation type 1, the $\quad\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}\left(N_{\mathrm{RB}}^{\mathrm{DL}, \mathrm{BWP}}+1\right) / 2\right)\right\rceil$ LSBs provide the resource allocation as defined in Clause 5.1.2.2.2 of [6, TS 38.214]

If "Bandwidth part indicator" field indicates a bandwidth part other than the active bandwidth part and if resourceAllocation is configured as 'dynamicSwitch' for the indicated bandwidth part, the UE assumes resource allocation type 0 for the indicated bandwidth part if the bitwidth of the "Frequency domain resource assignment" field of the active bandwidth part is smaller than the bitwidth of the "Frequency domain resource assignment" field of the indicated bandwidth part.

- Time domain resource assignment $-0,1,2,3$, or 4 bits as defined in Clause 5.1.2.1 of [6, TS 38.214]. The bitwidth for this field is determined as $\left\lceil\log _{2}(I)\right\rceil$ bits, where $I$ is the number of entries in the higher layer parameter pdsch-TimeDomainAllocationList if the higher layer parameter is configured; otherwise $I$ is the number of entries in the default table.
- VRB-to-PRB mapping -0 or 1 bit:
- 0 bit if only resource allocation type 0 is configured or if interleaved VRB-to-PRB mapping is not configured by high layers;
- 1 bit according to Table 7.3.1.2.2-5 otherwise, only applicable to resource allocation type 1 , as defined in Clause 7.3.1.6 of [4, TS 38.211].
- PRB bundling size indicator - 0 bit if the higher layer parameter prb-BundlingType is not configured or is set to 'staticBundling', or 1 bit if the higher layer parameter prb-BundlingType is set to 'dynamicBundling' according to Clause 5.1.2.3 of [6, TS 38.214].
- Rate matching indicator $-0,1$, or 2 bits according to higher layer parameters rateMatchPatternGroup1 and rateMatchPatternGroup2, where the MSB is used to indicate rateMatchPatternGroup1 and the LSB is used to indicate rateMatchPatternGroup2 when there are two groups.
- ZP CSI-RS trigger -0 , 1 , or 2 bits as defined in Clause 5.1.4.2 of [6, TS 38.214]. The bitwidth for this field is determined as $\left\lceil\log _{2}\left(n_{\mathrm{ZP}}+1\right)\right\rceil$ bits, where $\quad n_{\mathrm{ZP}} \quad$ is the number of aperiodic ZP CSI-RS resource sets configured by higher layer.

For transport block 1:

- Modulation and coding scheme - 5 bits as defined in Clause 5.1.3.1 of [6, TS 38.214]
- New data indicator - 1 bit
- Redundancy version - 2 bits as defined in Table 7.3.1.1.1-2

For transport block 2 (only present if maxNrofCodeWordsScheduledByDCI equals 2):

- Modulation and coding scheme - 5 bits as defined in Clause 5.1.3.1 of [6, TS 38.214]
- New data indicator - 1 bit
- Redundancy version - 2 bits as defined in Table 7.3.1.1.1-2

If "Bandwidth part indicator" field indicates a bandwidth part other than the active bandwidth part and the value of maxNrofCodeWordsScheduledByDCI for the indicated bandwidth part equals 2 and the value of maxNrofCodeWordsScheduledByDCI for the active bandwidth part equals 1, the UE assumes zeros are padded when interpreting the "Modulation and coding scheme", "New data indicator", and "Redundancy version" fields of transport block 2 according to Clause 12 of [5, TS38.213], and the UE ignores the "Modulation and coding scheme", "New data indicator", and "Redundancy version" fields of transport block 2 for the indicated bandwidth part.

- HARQ process number - 4 bits
- Downlink assignment index - number of bits as defined in the following
- 6 bits if more than one serving cell are configured in the DL and the higher layer parameter nfi-TotalDAIIncluded=true = enable. The 4 MSB bits are the counter DAI and the total DAI for the scheduled PDSCH group, and the 2 LSB bits are the total DAI for the non-scheduled PDSCH group.
- 4 bits if only one serving cell are configured in the DL and the higher layer parameter nfi-TotalDAIIncluded=true $=$ enable. The 2 MSB bits are the counter DAI for the scheduled PDSCH group, and the 2 LSB bits are the total DAI for the non-scheduled PDSCH group;
- 4 bits if more than one serving cell are configured in the DL, the higher layer parameter pdsch-HARQ-ACKCodebook=dynamic or pdsch-HARQ-ACK-Codebook-r16= enhancedDynamic, and nfi-TotalDAIIncluded=true is not configured, where the 2 MSB bits are the counter DAI and the 2 LSB bits are the total DAI;
- 4 bits if one serving cell is configured in the DL, and the higher layer parameter pdsch-HARQ-ACKCodebook=dynamic, and the UE is not provided coresetPoolIndex or is provided coresetPoolIndex with value 0 for one or more first CORESETs and is provided coresetPoolIndex with value 1 for one or more second CORESETs, and is provided ackNackFeedbackMode $=$ joint, where the 2 MSB bits are the counter DAI and the 2 LSB bits are the total DAI;
- 2 bits if only one serving cell is configured in the DL, the higher layer parameter $p d s c h-H A R Q-A C K-$ Codebook=dynamic or pdsch-HARQ-ACK-Codebook-r16=enhancedDynamic, and nfi-TotalDAIIncluded=true is not configured, when the UE is not configured with coresetPoolIndex or the value of coresetPoolIndex is the same for all CORESETs if coresetPoolIndex is provided or the UE is not configured with ackNackFeedbackMode = joint, where the 2 bits are the counter DAI;
- 0 bits otherwise.

If higher layer parameter priorityIndicatorDCI-1-1 is configured, if the bit width of the Downlink assignment index in DCI format 1_1 for one HARQ-ACK codebook is not equal to that of the Downlink assignment index in DCI format 1_1 for the other HARQ-ACK codebook, a number of most significant bits with value set to ' 0 ' are inserted to smaller Downlink assignment index until the bit width of the Downlink assignment index in DCI format $1 \_1$ for the two HARQ-ACK codebooks are the same.

- TPC command for scheduled PUCCH - 2 bits as defined in Clause 7.2 .1 of [5, TS 38.213]
- PUCCH resource indicator - 3 bits as defined in Clause 9.2.3 of [5, TS 38.213]
- PDSCH-to-HARQ_feedback timing indicator - 0 , 1 , 2 , or 3 bits as defined in Clause 9.2.3 of [5, TS 38.213]. The bitwidth for this field is determined as $\left\lceil\log _{2}(I)\right\rceil$ bits, where $I$ is the number of entries in the higher layer parameter dl-DataToUL-ACK.

If higher layer parameter priorityIndicatorDCI-1-1 is configured, if the bit width of the PDSCH-toHARQ_feedback timing indicator in DCI format 1_1 for one HARQ-ACK codebook is not equal to that of the PDSCH-to-HARQ_feedback timing indicator in DCI format 1_1 for the other HARQ-ACK codebook, a number of most significant bits with value set to '0' are inserted to smaller PDSCH-to-HARQ_feedback timing indicator until the bit width of the PDSCH-to-HARQ_feedback timing indicator in DCI format $1 \_1$ for the two HARQACK codebooks are the same.

- One-shot HARQ-ACK request - 0 or 1 bit.
- 1 bit if higher layer parameter pdsch-HARQ-ACK-OneShotFeedback-r16 is configured;
- 0 bit otherwise.
- PDSCH group index - 0 or 1 bit.
- 1 bit if the higher layer parameter pdsch-HARQ-ACK-Codebook-r16= enhancedDynamic;
- 0 bit otherwise.
- New feedback indicator -0 , 1 or 2 bits.
- 1 bit if the higher layer parameter pdsch-HARQ-ACK-Codebook-r16= enhancedDynamic and the higher layer parameter nfi-TotalDAI-Included is not configured;
- 2 bits if the higher layer parameter pdsch-HARQ-ACK-Codebook-r16= enhancedDynamic and the higher layer parameter nfi-TotalDAI-Included=true; the MSB corresponds to the scheduled PDSCH group, and the LSB corresponds to the non-scheduled PDSCH group, as defined in [TS38.213] clause 9.1.3.3
- 0 bit otherwise.
- Number of requested PDSCH group(s) - 0 or 1 bit.
- 1 bit if the higher layer parameter pdsch-HARQ-ACK-Codebook-r16= enhancedDynamic;
- 0 bit otherwise.
- Antenna port(s) - 4, 5 , or 6 bits as defined by Tables 7.3.1.2.2-1/2/3/4 and Tables 7.3.1.2.2-1A/2A/3A/4A, where the number of CDM groups without data of values 1,2 , and 3 refers to $\operatorname{CDM}$ groups $\{0\},\{0,1\}$, and $\{0,1,2\}$ respectively. The antenna ports $\left\{p_{0, \ldots,}, p_{v-1}\right\} \quad$ shall be determined according to the ordering of DMRS port(s) given by Tables 7.3.1.2.2-1/2/3/4 or Tables 7.3.1.2.2-1A/2A/3A/4A. When a UE receives an activation command that maps at least one codepoint of DCI field 'Transmission Configuration Indication' to two TCI states, the UE shall use Table 7.3.1.2.2-1A/2A/3A/4A; otherwise, it shall use Tables 7.3.1.2.2-1/2/3/4. The UE can receive an entry with DMRS ports equals to 1000, 1002, 1003 when two TCI states are indicated in a codepoint of DCI field 'Transmission Configuration Indication' [and subject to UE capability].

If a UE is configured with both dmrs-DownlinkForPDSCH-MappingTypeA and dmrs-DownlinkForPDSCHMappingTypeB, the bitwidth of this field equals $\max \left\{x_{A}, x_{B}\right\}$, where $X_{A}$ is the "Antenna ports" bitwidth derived according to dmrs-DownlinkForPDSCH-MappingTypeA and $X_{B}$ is the "Antenna ports" bitwidth derived according to dmrs-DownlinkForPDSCH-MappingTypeB. A number of $\left|x_{A}-x_{B}\right|$ zeros are padded in the MSB of this field, if the mapping type of the PDSCH corresponds to the smaller value of $X_{A}$ and $X_{B}$.

- Transmission configuration indication - 0 bit if higher layer parameter tci-PresentInDCI is not enabled; otherwise 3 bits as defined in Clause 5.1.5 of [6, TS38.214].

If "Bandwidth part indicator" field indicates a bandwidth part other than the active bandwidth part,

- if the higher layer parameter tci-PresentInDCI is not enabled for the CORESET used for the PDCCH carrying the DCI format 1_1,
- the UE assumes tci-PresentInDCI is not enabled for all CORESETs in the indicated bandwidth part;
- otherwise,
- the UE assumes tci-PresentInDCI is enabled for all CORESETs in the indicated bandwidth part.
- $\quad$ SRS request - 2 bits as defined by Table 7.3.1.1.2-24 for UEs not configured with supplementaryUplink in ServingCellConfig in the cell; 3 bits for UEs configured with supplementaryUplink in ServingCellConfig in the cell where the first bit is the non-SUL/SUL indicator as defined in Table 7.3.1.1.1-1 and the second and third bits
are defined by Table 7.3.1.1.2-24. This bit field may also indicate the associated CSI-RS according to Clause 6.1.1.2 of [6, TS 38.214].
- CBG transmission information (CBGTI) - 0 bit if higher layer parameter codeBlockGroupTransmission for PDSCH is not configured, otherwise, 2, 4, 6, or 8 bits as defined in Clause 5.1.7 of [6, TS38.214], determined by the higher layer parameters maxCodeBlockGroupsPerTransportBlock and maxNrofCodeWordsScheduledByDCI for the PDSCH.

If higher layer parameter priorityIndicatorDCI-1-1 is configured, if the bit width of the CBG transmission information in DCI format 1_1 for one HARQ-ACK codebook is not equal to that of the CBG transmission information in DCI format 1_1 for the other HARQ-ACK codebook, a number of most significant bits with value set to ' 0 ' are inserted to smaller CBG transmission information until the bit width of the CBG transmission information in DCI format 1_1 for the two HARQ-ACK codebooks are the same.

- CBG flushing out information (CBGFI) - 1 bit if higher layer parameter codeBlockGroupFlushIndicator is configured as "TRUE", 0 bit otherwise.

If higher layer parameter priorityIndicatorDCI-1-1 is configured, if the bit width of the CBG flushing out information in DCI format 1_1 for one HARQ-ACK codebook is not equal to that of the CBG flushing out information in DCI format 1_1 for the other HARQ-ACK codebook, a number of most significant bits with value set to ' 0 ' are inserted to smaller CBG flushing out information until the bit width of the CBG flushing out information in DCI format 1_1 for the two HARQ-ACK codebooks are the same.

- DMRS sequence initialization - 1 bit.
- Priority indicator - 0 bit if higher layer parameter priorityIndicatorDCI-1-1 is not configured; otherwise 1 bit as defined in Clause 9 in [5, TS 38.213].
- ChannelAccess-CPext $-0,1,2,3$ or 4 bits. The bitwidth for this field is determined as $\left\lceil\log _{2}(I)\right\rceil$ bits, where $I$ is the number of entries in the higher layer parameter ul-AccessConfigListDCI-1-1 for operation in a cell with shared spectrum channel access; otherwise 0 bit. One or more entries from Table 7.3.1.2.2-6 are configured by the higher layer parameter ul-AccessConfigListDCI-1-1.
- Minimum applicable scheduling offset indicator - 0 or 1 bit
- 0 bit if higher layer parameter minimumSchedulingOffsetK0 is not configured;
- 1 bit if higher layer parameter minimumSchedulingOffsetK0 is configured. The 1 bit indication is used to determine the minimum applicable K0 for the active DL BWP and the minimum applicable K2 value for the active UL BWP, if configured respectively, according to Table 7.3.1.1.2-33. If the minimum applicable K0 is indicated, the minimum applicable value of the aperiodic CSI-RS triggering offset for an active DL BWP shall be the same as the minimum applicable K0 value.
- SCell dormancy indication - 0 bit if higher layer parameter dormancyGroupWithinActiveTime is not configured; otherwise 1, 2, 3, 4 or 5 bits bitmap determined according to higher layer parameter
dormancyGroupWithinActiveTime, where each bit corresponds to one of the SCell group(s) configured by higher layers parameter dormancyGroupWithinActiveTime, with MSB to LSB of the bitmap corresponding to the first to last configured SCell group. The field is only present when this format is carried by PDCCH on the primary cell within DRX Active Time and the UE is configured with at least two DL BWPs for an SCell.

If one-shot HARQ-ACK request is not present or set to ' 0 ', and all bits of frequency domain resource assignment are set to 0 for resource allocation type 0 or set to 1 for resource allocation type 1 or set to 0 or 1 for dynamic switch resource allocation type, this field is reserved and the following fields among the fields above are used for SCell dormancy indication, where each bit corresponds to one of the configured SCell(s), with MSB to LSB of the following fields concatenated in the order below corresponding to the SCell with lowest to highest SCell index

- Modulation and coding scheme of transport block 1
- New data indicator of transport block 1
- Redundancy version of transport block 1
- HARQ process number
- Antenna port(s)
- DMRS sequence initialization

If DCI formats $1 \_1$ are monitored in multiple search spaces associated with multiple CORESETs in a BWP for scheduling the same serving cell, zeros shall be appended until the payload size of the DCI formats 1_1 monitored in the multiple search spaces equal to the maximum payload size of the DCI format 1_1 monitored in the multiple search spaces.

### 7.3.1.2.3 Format 1_2

DCI format $1 \_2$ is used for the scheduling of PDSCH in one cell.
The following information is transmitted by means of the DCI format $1 \_2$ with CRC scrambled by C-RNTI or CSRNTI or MCS-C-RNTI:

- Identifier for DCI formats - 1 bits
- The value of this bit field is always set to 1 , indicating a DL DCI format.
- Carrier indicator - 0, 1, 2 or 3 bits determined by higher layer parameter carrierIndicatorSizeDCI-1-2, as defined in Clause 10.1 of [5, TS38.213].
- Bandwidth part indicator -0 , 1 or 2 bits as determined by the number of DL BWPs $n_{B W P, R R C}$ configured by higher layers, excluding the initial DL bandwidth part. The bitwidth for this field is determined as
$\left\lceil\log _{2}\left(n_{B W P}\right)\right\rceil$ bits, where
- $\quad n_{B W P}=n_{B W P, R R C}+1$ if $n_{B W P, R R C} \leq 3$, in which case the bandwidth part indicator is equivalent to the ascending order of the higher layer parameter BWP-Id;
- otherwise $n_{B W P}=n_{B W P, R R C}$, in which case the bandwidth part indicator is defined in Table 7.3.1.1.2-1;

If a UE does not support active BWP change via DCI, the UE ignores this bit field.

- Frequency domain resource assignment - number of bits determined by the following:
- $\quad N_{\text {RBG }}$ bits if only resource allocation type 0 is configured, where $N_{R B G}$ is defined in Clause 5.1.2.2.1 of [6, TS 38.214];
- $\quad\left[\log _{2}\left(N_{R B G, K 2}\left(N_{R B G, K 2}+1\right) / 2\right)\right\rceil$ bits if only resource allocation type 1 is configured, or $\left.\max \left(\Gamma \log _{2}\left(N_{R B G, К 2}\left(N_{R B G, К 2}+1\right) / 2\right)\right\rceil, N_{R B G}\right)+1$ bits if resourceAllocationDCI-1-2-r16 is configured as 'dynamicSwitch', where $\quad N_{R B G, K 2}=\Gamma\left(N_{R B}^{D L, B W P}+\left(N_{D L, B W P}^{\text {start }} \bmod K 2\right)\right) / K 27$, $N_{R B}^{D L, B W P}$ is the size of the active DL bandwidth part, $\quad N_{D L, B W P}^{s t a r t}$ is defined as in clause 4.4.4.4 of [4, TS 38.211] and $K 2$ is determined by higher layer parameter resourceAllocationType1GranularityDCI-1-2. If the higher layer parameter resourceAllocationType1GranularityDCI-1-2 is not configured, K2 is equal to 1 .
- If resourceAllocationDCI-1-2-r16 is configured as 'dynamicSwitch', the MSB bit is used to indicate resource allocation type 0 or resource allocation type 1 , where the bit value of 0 indicates resource allocation type 0 and the bit value of 1 indicates resource allocation type 1 .
- For resource allocation type 0 , the $\quad N_{\text {RBG }} \quad$ LSBs provide the resource allocation as defined in Clause 5.1.2.2.1 of [6, TS 38.214].
- For resource allocation type 1, the $\quad\left\lceil\log _{2}\left(N_{R B G, K 2}\left(N_{R B G, K 2}+1\right) / 2\right)\right\rceil \quad$ LSBs provide the resource allocation as defined in Clause 5.1.2.2.2 of [6, TS 38.214]

If "Bandwidth part indicator" field indicates a bandwidth part other than the active bandwidth part and if resourceAllocationDCI-1-2-r16 is configured as 'dynamicSwitch' for the indicated bandwidth part, the UE assumes resource allocation type 0 for the indicated bandwidth part if the bitwidth of the "Frequency domain resource assignment" field of the active bandwidth part is smaller than the bitwidth of the "Frequency domain resource assignment" field of the indicated bandwidth part.

- Time domain resource assignment $-0,1,2,3$, or 4 bits as defined in Clause 5.1.2.1 of [6, TS 38.214]. The bitwidth for this field is determined as $\left\lceil\log _{2}(I)\right\rceil$ bits, where $I$ is the number of entries in the higher layer parameter pdsch-TimeDomainAllocationListDCI-1-2 if the higher layer parameter is configured, or $I$ is the number of entries in the higher layer parameter pdsch-TimeDomainAllocationList if the higher layer parameter pdsch-TimeDomainAllocationList is configured when the higher layer parameter pdsch-
TimeDomainAllocationListDCI-1-2 is not configured; otherwise $I$ is the number of entries in the default table.
- VRB-to-PRB mapping - 0 or 1 bit:
- 0 bit if the higher layer parameter vrb-ToPRB-InterleaverDCI-1-2 is not configured;
- 1 bit according to Table 7.3.1.2.2-5 otherwise, only applicable to resource allocation type 1 , as defined in Clause 7.3.1.6 of [4, TS 38.211].
- PRB bundling size indicator - 0 bit if the higher layer parameter prb-BundlingTypeDCI-1-2 is not configured or is set to 'static', or 1 bit if the higher layer parameter prb-BundlingTypeDCI-1-2 is set to 'dynamic' according to Clause 5.1.2.3 of [6, TS 38.214].
- Rate matching indicator -0 , 1 , or 2 bits according to higher layer parameters rateMatchPatternGroup1DCI-1-2 and rateMatchPatternGroup2DCI-1-2, where the MSB is used to indicate rateMatchPatternGroup1DCI-1-2 and the LSB is used to indicate rateMatchPatternGroup2DCI-1-2 when there are two groups.
- ZP CSI-RS trigger -0 , 1 , or 2 bits as defined in Clause 5.1.4.2 of [6, TS 38.214]. The bitwidth for this field is determined as $\left\lceil\log _{2}\left(n_{Z P}+1\right)\right\rceil$ bits, where $n_{Z P}$ is the number of aperiodic ZP CSI-RS resource sets configured by higher layer parameter aperiodicZP-CSI-RS-ResourceSetsToAddModListDCI-1-2.
- Modulation and coding scheme - 5 bits as defined in Clause 5.1.3.1 of [6, TS 38.214]
- New data indicator - 1 bit
- Redundancy version -0 , 1 or 2 bits determined by higher layer parameter numberOfBitsForRV-DCI-1-2
- If 0 bit is configured, $r v_{i d}$ to be applied is 0 ;
- $\quad 1$ bit according to Table 7.3.1.2.3-1;
- $\quad 2$ bits according to Table 7.3.1.1.1-2.
- HARQ process number $-0,1,2,3$ or 4 bits determined by higher layer parameter harq-ProcessNumberSizeDCI-1-2
- Downlink assignment index $-0,1,2$ or 4 bits
- 0 bit if the higher layer parameter downlinkAssignmentIndexDCI-1-2 is not configured;
- 1,2 or 4 bits determined by higher layer parameter downlinkAssignmentIndexDCI-1-2 otherwise,
- 4 bits if more than one serving cell are configured in the DL and the higher layer parameter $p d s c h-H A R Q-$ ACK-Codebook=dynamic, where the 2 MSB bits are the counter DAI and the 2 LSB bits are the total DAI
- 4 bits if one serving cell are configured in the DL and the higher layer parameter $p d s c h-H A R Q-A C K-$ Codebook=dynamic, and the UE is not provided coresetPoolIndex or is provided coresetPoolIndex with value 0 for one or more first CORESETs and is provided coresetPoolIndex with value 1 for one or more second CORESETs, and is provided ackNackFeedbackMode $=$ joint, where the 2 MSB bits are the counter DAI and the 2 LSB bits are the total DAI.
- 1 or 2 bits if only one serving cell is configured in the DL and the higher layer parameter $p d s c h-H A R Q$ -ACK-Codebook=dynamic, when the UE is not configured with coresetPoolIndex or the value of coresetPoolIndex is the same for all CORESETs if coresetPoolIndex is provided or the UE is not configured with ackNackFeedbackMode $=$ joint, where the 1 bit or 2 bits are the counter DAI.

If higher layer parameter priorityIndicatorDCI-1-2 is configured, if the bit width of the Downlink assignment index in DCI format $1 \_2$ for one HARQ-ACK codebook is not equal to that of the Downlink assignment index in DCI format $1 \_2$ for the other HARQ-ACK codebook, a number of most significant bits with value set to ' 0 ' are inserted to smaller Downlink assignment index until the bit width of the Downlink assignment index in DCI format 1_2 for the two HARQ-ACK codebooks are the same.

- TPC command for scheduled PUCCH - 2 bits as defined in Clause 7.2.1 of [5, TS 38.213]
- PUCCH resource indicator - 0 or 1 or 2 or 3 bits determined by higher layer parameter numberOfBitsForPUCCH-ResourceIndicatorDCI-1-2
- PDSCH-to-HARQ_feedback timing indicator - 0 , 1, 2, or 3 bits as defined in Clause 9.2.3 of [5, TS 38.213]. The bitwidth for this field is determined as $\left\lceil\log _{2}(I)\right\rceil$ bits, where $I$ is the number of entries in the higher layer parameter DL-DataToUL-ACK-DCI-1-2.

If higher layer parameter priorityIndicatorDCI-1-2 is configured, if the bit width of the PDSCH-toHARQ_feedback timing indicator in DCI format $1 \_2$ for one HARQ-ACK codebook is not equal to that of the PDSCH-to-HARQ_feedback timing indicator in DCI format 1_2 for the other HARQ-ACK codebook, a number of most significant bits with value set to '0' are inserted to smaller PDSCH-to-HARQ_feedback timing indicator until the bit width of the PDSCH-to-HARQ_feedback timing indicator in DCI format $1 \_2$ for the two HARQACK codebooks are the same.

- Antenna port(s) $-0,4,5$, or 6 bits
- 0 bit if higher layer parameter antennaPortsFieldPresenceDCI-1-2 is not configured;
- Otherwise 4, 5 or 6 bits as defined by Tables 7.3.1.2.2-1/2/3/4, where the number of CDM groups without data of values 1 , 2 , and 3 refers to CDM groups $\{0\},\{0,1\}$, and $\{0,1,2\}$ respectively. The antenna ports $\left\{p_{0}, \ldots, p_{v-1}\right\}$ shall be determined according to the ordering of DMRS port(s) given by Tables 7.3.1.2.2$1 / 2 / 3 / 4$. If a UE is configured with both dmrs-DownlinkForPDSCH-MappingTypeA-DCI-1-2 and dmrs-DownlinkForPDSCH-MappingTypeB-DCI-1-2 and is configured with higher layer parameter antennaPortsFieldPresenceDCI-1-2, the bitwidth of this field equals $\max \left\{x_{A}, x_{B}\right\}$, where $x_{A}$ is the "Antenna ports" bitwidth derived according to dmrs-DownlinkForPDSCH-MappingTypeA-DCI-1-2 and $x_{B}$ is the "Antenna ports" bitwidth derived according to dmrs-DownlinkForPDSCH-MappingTypeB-DCI-1-2. A number of $\left|x_{A}-x_{B}\right| \quad$ zeros are padded in the MSB of this field, if the mapping type of the PDSCH corresponds to the smaller value of $x_{A}$ and $x_{B}$.

If a UE is not configured with higher layer parameter antennaPortsFieldPresenceDCI-1-2, antenna port(s) are defined assuming bit field index value 0 in Tables 7.3.1.2.2-1/2/3/4.

- Transmission configuration indication - 0 bit if higher layer parameter tci-PresentDCI-1-2 is not configured; otherwise 1 or 2 or 3 bits determined by higher layer parameter tci-PresentDCI-1-2 as defined in Clause 5.1.5 of [6, TS38.214].

If "Bandwidth part indicator" field indicates a bandwidth part other than the active bandwidth part,

- if the higher layer parameter tci-PresentDCI-1-2 is not configured for the CORESET used for the PDCCH carrying the DCI format $1 \_2$,
- the UE assumes tci-PresentDCI-1-2 is not configured for all CORESETs in the indicated bandwidth part;
- otherwise,
- the UE assumes tci-PresentDCI-1-2 is configured for all CORESETs in the indicated bandwidth part with the same value configured for the CORESET used for the PDCCH carrying the DCI format $1 \_2$.
- SRS request $-0,1$, 2 or 3 bits
- 0 bit if the higher layer parameter srs-RequestDCI-1-2 is not configured;
- 1 bit as defined by Table 7.3.1.1.3-1 if the higher layer parameter srs-RequestDCI-1-2 = 1 and for UEs not configured with supplementaryUplink in ServingCellConfig in the cell;
- 2 bits if the higher layer parameter srs-RequestDCI-1-2 = 1 and for UEs configured with supplementaryUplink in ServingCellConfig in the cell, where the first bit is the non-SUL/SUL indicator as defined in Table 7.3.1.1.1-1 and the second bit is defined by Table 7.3.1.1.3-1;
- 2 bits as defined by Table 7.3.1.1.2-24 if the higher layer parameter srs-RequestDCI-1-2 $=2$ and for UEs not configured with supplementaryUplink in ServingCellConfig in the cell;
- 3 bits if the higher layer parameter srs-RequestDCI-1-2 = 2 and for UEs configured with supplementaryUplink in ServingCellConfig in the cell, where the first bit is the non-SUL/SUL indicator as defined in Table 7.3.1.1.1-1 and the second and third bits are defined by Table 7.3.1.1.2-24;
- DMRS sequence initialization -0 or 1 bit
- 0 bit if the higher layer parameter dmrs-SequenceInitializationDCI-1-2 is not configured;
- 1 bit otherwise.
- Priority indicator - 0 bit if higher layer parameter priorityIndicatorDCI-1-2 is not configured; otherwise 1 bit as defined in Clause 9 in [5, TS 38.213].

If DCI formats $1 \_2$ are monitored in multiple search spaces associated with multiple CORESETs in a BWP for scheduling the same serving cell, zeros shall be appended until the payload size of the DCI formats 1_2 monitored in the multiple search spaces equal to the maximum payload size of the DCI format $1 \_2$ monitored in the multiple search spaces.

Table 7.3.1.2.3-1: Redundancy version

| Value of the Redundancy version field | Value of $r V_{\text {id }}$ | to be applied |
| :---: | :---: | :---: |
| 0 | 0 |  |
| 1 | 3 |  |

### 7.3.1.3 DCI formats for other purposes

### 7.3.1.3.1 Format 2_0

DCI format 2_0 is used for notifying the slot format, COT duration, available RB set, and search space set group switching.

The following information is transmitted by means of the DCI format $2 \_0$ with CRC scrambled by SFI-RNTI:

- If the higher layer parameter slotFormatCombToAddModList is configured,
- Slot format indicator 1 , Slot format indicator $2, \ldots$, Slot format indicator $N$,
- If the higher layer parameter availableRB-SetsToAddModList is configured,
- Available RB set Indicator 1, Available RB set Indicator 2, ..., Available RB set Indicator N1,
- If the higher layer parameter co-DurationsPerCellToAddModList is configured
- COT duration indicator 1, COT duration indicator 2, $\ldots$, COT duration indicator N2.
- If the higher layer parameter switchTriggerToAddModList is configured
- Search space set group switching flag 1, Search space set group switching flag 2, ..., Search space set group switching flag $M$.

The size of DCI format 2_0 is configurable by higher layers up to 128 bits, according to Clause 11.1.1 of [5, TS 38.213].

### 7.3.1.3.2 Format 2_1

DCI format 2_1 is used for notifying the PRB(s) and OFDM symbol(s) where UE may assume no transmission is intended for the UE.

The following information is transmitted by means of the DCI format 2_1 with CRC scrambled by INT-RNTI:

- Pre-emption indication 1, Pre-emption indication 2, $\ldots$, Pre-emption indication $N$.

The size of DCI format 2_1 is configurable by higher layers up to 126 bits, according to Clause 11.2 of [5, TS 38.213]. Each pre-emption indication is 14 bits.

### 7.3.1.3.3 Format 2_2

DCI format 2_2 is used for the transmission of TPC commands for PUCCH and PUSCH.
The following information is transmitted by means of the DCI format 2_2 with CRC scrambled by TPC-PUSCH-RNTI or TPC-PUCCH-RNTI:

- block number 1 , block number $2, \ldots$, block number $N$

The parameter tpc-PUSCH or tpc-PUCCH provided by higher layers determines the index to the block number for an UL of a cell, with the following fields defined for each block:

- Closed loop indicator -0 or 1 bit.
- For DCI format 2_2 with TPC-PUSCH-RNTI, 0 bit if the UE is not configured with high layer parameter twoPUSCH-PC-AdjustmentStates, in which case UE assumes each block in the DCI format 2 _2 is of 2 bits; 1 bit otherwise, in which case UE assumes each block in the DCI format $2 \_2$ is of 3 bits;
- For DCI format 2_2 with TPC-PUCCH-RNTI, 0 bit if the UE is not configured with high layer parameter twoPUCCH-PC-AdjustmentStates, in which case UE assumes each block in the DCI format $2 \_2$ is of 2 bits; 1 bit otherwise, in which case UE assumes each block in the DCI format $2 \_2$ is of 3 bits;
- TPC command -2 bits

The number of information bits in format $2 \_2$ shall be equal to or less than the payload size of format $1 \_0$ monitored in common search space in the same serving cell. If the number of information bits in format $2 \_2$ is less than the payload size of format $1 \_0$ monitored in common search space in the same serving cell, zeros shall be appended to format $2 \_2$ until the payload size equals that of format $1 \_0$ monitored in common search space in the same serving cell.

### 7.3.1.3.4 Format 2_3

DCI format $2 \_3$ is used for the transmission of a group of TPC commands for SRS transmissions by one or more UEs. Along with a TPC command, a SRS request may also be transmitted.

The following information is transmitted by means of the DCI format $2 \_3$ with CRC scrambled by TPC-SRS-RNTI:

- block number 1, block number 2, $\ldots$, block number $B$
where the starting position of a block is determined by the parameter startingBitOfFormat2-3 or startingBitOfFormat2-3SUL-v1530 provided by higher layers for the UE configured with the block.

If the UE is configured with higher layer parameter srs-TPC-PDCCH-Group = typeA for an UL without PUCCH and PUSCH or an UL on which the SRS power control is not tied with PUSCH power control, one block is configured for the UE by higher layers, with the following fields defined for the block:

- SRS request - 0 or 2 bits. The presence of this field is according to the definition in Clause 11.4 of [5, TS38.213]. If present, this field is interpreted as defined by Table 7.3.1.1.2-24.
- TPC command number 1, TPC command number $2, \ldots$, TPC command number $N$, where each TPC command applies to a respective UL carrier provided by higher layer parameter cc-IndexInOneCC-Set
If the UE is configured with higher layer parameter srs-TPC-PDCCH-Group = typeB for an UL without PUCCH and PUSCH or an UL on which the SRS power control is not tied with PUSCH power control, one block or more blocks is configured for the UE by higher layers where each block applies to an UL carrier, with the following fields defined for each block:
- SRS request - 0 or 2 bits. The presence of this field is according to the definition in Clause 11.4 of [5, TS38.213]. If present, this field is interpreted as defined by Table 7.3.1.1.2-24.
- TPC command -2 bits

The number of information bits in format $2 \_3$ shall be equal to or less than the payload size of format $1 \_0$ monitored in common search space in the same serving cell. If the number of information bits in format $2 \_3$ is less than the payload size of format 1_0 monitored in common search space in the same serving cell, zeros shall be appended to format 2_3 until the payload size equals that of format $1 \_0$ monitored in common search space in the same serving cell.

### 7.3.1.3.5 Format 2_4

DCI format 2_4 is used for notifying the PRB(s) and OFDM symbol(s) where UE cancels the corresponding UL transmission from the UE according to Clause 11.2A of [5, TS 38.213].

The following information is transmitted by means of the DCI format $2 \_4$ with CRC scrambled by ci-RNTI:

- Cancellation indication 1, Cancellation indication 2, ..., Cancellation indication indication $N$.

The size of DCI format $2 \_4$ is configurable by higher layers parameter dci-PayloadSizeForCI up to 126 bits, according to Clause 11.2A of [5, TS 38.213]. The number of bits for each cancellation indication is configurable by higher layer parameter ci-PayloadSize. For a UE, there is at most one cancellation indication for an UL carrier.

### 7.3.1.3.6 Format 2_5

DCI format 2_5 is used for notifying the availability of soft resources as defined in Clause 9.3.1 of [10, TS 38.473]
The following information is transmitted by means of the DCI format $2 \_5$ with CRC scrambled by AI-RNTI:

- Availability indicator 1, Availability indicator 2, ..., Availability indicator $N$.

The size of DCI format 2_5 is configurable by higher layers up to 128 bits, according to Clause 14 of [5, TS 38.213].

### 7.3.1.3.7 Format 2_6

DCI format 2_6 is used for notifying the power saving information outside DRX Active Time for one or more UEs.
The following information is transmitted by means of the DCI format 2_6 with CRC scrambled by PS-RNTI:

- block number 1 , block number 2,..., block number $N$
where the starting position of a block is determined by the parameter ps-PositionDCI-2-6 provided by higher layers for the UE configured with the block.

If the UE is configured with higher layer parameter $p s$-RNTI and dci-Format2-6, one block is configured for the UE by higher layers, with the following fields defined for the block:

- Wake-up indication - 1 bit
- SCell dormancy indication - 0 bit if higher layer parameter dormancyGroupOutsideActiveTime is not configured; otherwise 1, 2, 3, 4 or 5 bits bitmap determined according to higher layer parameter dormancyGroupOutsideActiveTime, where each bit corresponds to one of the SCell group(s) configured by higher layers parameter dormancyGroupOutsideActiveTime, with MSB to LSB of the bitmap corresponding to the first to last configured SCell group.

The size of DCI format 2_6 is indicated by the higher layer parameter sizeDCI-2-6, according to Clause 10.3 of [5, TS 38.213].

### 7.3.1.4 $\quad \mathrm{DCI}$ formats for scheduling of sidelink

### 7.3.1.4.1 Format 3_0

DCI format 3_0 is used for scheduling of NR PSCCH and NR PSSCH in one cell.
The following information is transmitted by means of the DCI format 3_0 with CRC scrambled by SL-RNTI or SL-CSRNTI:

- Resource pool index - $\left\lceil\log _{2} I\right\rceil$ bits, where $I$ is the number of resource pools for transmission configured by the higher layer parameter sl-TxPoolScheduling.
- Time gap - 3 bits determined by higher layer parameter sl-DCI-ToSL-Trans, as defined in clause 8.1.2.1 of [6, TS 38.214]
- HARQ process number - 4 bits as defined in clause 16.4 of [5, TS 38.213]
- New data indicator - 1 bit as defined in clause 16.4 of [5, TS 38.213]
- Lowest index of the subchannel allocation to the initial transmission $\left.-\Gamma \log _{2}\left(\mathrm{~N}_{\text {subChannel }}^{\mathrm{SL}}\right)\right\rceil$ bits as defined in clause 8.1.2.2 of [6, TS 38.214]
- SCI format 1-A fields according to clause 8.3.1.1:
- Frequency resource assignment.
- Time resource assignment.
- PSFCH-to-HARQ feedback timing indicator - $\left\lceil\log _{2} N_{f b_{\text {timing }}}\right]$ bits, where $N_{f b_{\text {timing }}}$ is the number of entries in the higher layer parameter sl-PSFCH-ToPUCCH, as defined in clause 16.5 of [5, TS 38.213]
- PUCCH resource indicator -3 bits as defined in clause 16.5 of [5, TS 38.213].
- Configuration index - 0 bit if the UE is not configured to monitor DCI format 3_0 with CRC scrambled by SL-CS-RNTI; otherwise 3 bits as defined in clause 8.1.2 of [6, TS 38.214]. If the UE is configured to monitor DCI format 3_0 with CRC scrambled by SL-CS-RNTI, this field is reserved for DCI format 3_0 with CRC scrambled by SL-RNTI.
- Counter sidelink assignment index - 2 bits
- 2 bits as defined in clause 16.5 .2 of [5, TS 38.213] if the UE is configured with pdsch-HARQ-ACKCodebook $=$ dynamic
- 2 bits as defined in clause 16.5 .1 of [5, TS 38.213] if the UE is configured with pdsch-HARQ-ACKCodebook $=$ semi-static
- Padding bits, if required

If multiple transmit resource pools are provided in sl-TxPoolScheduling, zeros shall be appended to the DCI format 3_0 until the payload size is equal to the size of a DCI format 3_0 given by a configuration of the transmit resource pool resulting in the largest number of information bits for DCI format 3_0.

If the UE is configured to monitor DCI format 3_1 and the number of information bits in DCI format 3_0 is less than the payload of DCI format 3_1, zeros shall be appended to DCI format 3_0 until the payload size equals that of DCI format 3_1.

### 7.3.1.4.2 Format 3_1

DCI format 3_1 is used for scheduling of LTE PSCCH and LTE PSSCH in one cell.
The following information is transmitted by means of the DCI format 3_1 with CRC scrambled by SL Semi-Persistent Scheduling V-RNTI:

- Timing offset - 3 bits determined by higher layer parameter sl-TimeOffsetEUTRA, as defined in clause 16.6 of [5, TS 38.213]
- Carrier indicator -3 bits as defined in 5.3.3.1.9A of [11, TS 36.212].
- Lowest index of the subchannel allocation to the initial transmission - $\left[\log _{2}\left(N_{\text {subchannel }}^{\mathrm{SL}}\right) \rrbracket\right.$ bits as defined in 5.3.3.1.9A of [11, TS 36.212].
- Frequency resource location of initial transmission and retransmission, as defined in 5.3.3.1.9A of [11, TS 36.212]
- Time gap between initial transmission and retransmission, as defined in 5.3.3.1.9A of [11, TS 36.212]
- $\quad$ SL index - 2 bits as defined in 5.3.3.1.9A of [11, TS 36.212]
- $\quad$ SL SPS configuration index -3 bits as defined in clause 5.3.3.1.9A of [11, TS 36.212].
- Activation/release indication - 1 bit as defined in clause 5.3.3.1.9A of [11, TS 36.212].

If the UE is configured to monitor DCI format $3 \_0$ and the number of information bits in DCI format $3 \_1$ is less than the payload of DCI format 3_0, zeros shall be appended to DCI format $3 \_1$ until the payload size equals that of DCI format 3_0.

### 7.3.2 CRC attachment

Error detection is provided on DCI transmissions through a Cyclic Redundancy Check (CRC).
The entire payload is used to calculate the CRC parity bits. Denote the bits of the payload by $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$, and the parity bits by $p_{0}, p_{1}, p_{2}, p_{3}, \ldots, p_{L-1}$, where $A$ is the payload size and $L$ is the number of parity bits. Let $a_{0}^{\prime}, a_{1}^{\prime}, a_{2}^{\prime}, a_{3}^{\prime}, \ldots, a^{\prime}{ }_{A+L-1}$ be a bit sequence such that $a_{i}^{\prime}=1$ for $i=0,1, \ldots, L-1$ and $a_{i}^{\prime}=a_{i-L}$ for $i=L, L+1, \ldots, A+L-1$. The parity bits are computed with input bit sequence $a_{0}^{\prime}, a_{1}^{\prime}, a_{2}^{\prime}, a_{3}^{\prime}, \ldots, a^{\prime}{ }_{A+L-1}$ and attached according to Clause 5.1 by setting $L$ to 24 bits and using the generator polynomial $g_{\text {CRC24C }}(D)$. The output bit $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{K-1}$ is

$$
\begin{array}{ll}
b_{k}=a_{k} \quad \text { for } \quad k=0,1,2, \ldots, A-1 \\
b_{k}=p_{k-A} & \text { for } \quad k=A, A+1, A+2, \ldots, A+L-1
\end{array}
$$

where $K=A+L$.
After attachment, the CRC parity bits are scrambled with the corresponding RNTI $X_{\text {rnti, } 0}, X_{\text {rnti, } 1}, \ldots, X_{\text {rnti,15 }}$, where
$X_{\text {rnti, } 0}$ corresponds to the MSB of the RNTI, to form the sequence of bits $C_{0}, C_{1}, C_{2}, C_{3}, \ldots, C_{K-1}$. The relation between $c_{k}$ and $b_{k}$ is:

$$
\begin{aligned}
& c_{k}=b_{k} \quad \text { for } k=0,1,2, \ldots, \quad A+7 \\
& c_{k}=\left(b_{k}+x_{r n t i, k-A-8}\right) \bmod 2 \quad \text { for } k=A+8, A+9, A+10, \ldots, A+23 .
\end{aligned}
$$

### 7.3.3 Channel coding

Information bits are delivered to the channel coding block. They are denoted by $\quad c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{K-1}$, where $K$ is the number of bits, and they are encoded via Polar coding according to Clause 5.3.1, by setting $n_{\max }=9, I_{I L}=1$,

$$
n_{P C}=0 \text {, and } n_{P C}^{w m}=0
$$

After encoding the bits are denoted by $d_{0}, d_{1}, d_{2}, d_{3}, \ldots, d_{N-1}$, where $N$ is the number of coded bits.

### 7.3.4 Rate matching

The input bit sequence to rate matching is $d_{0}, d_{1}, d_{2}, \ldots, d_{N-1}$.
Rate matching is performed according to Clause 5.4 .1 by setting $\quad I_{B I L}=0$
The output bit sequence after rate matching is denoted as $f_{0}, f_{1}, f_{2}, \ldots, f_{E-1}$.

## 8 Sidelink transport channels and control information 8.1 Sidelink broadcast channel

The processing for SL-BCH transport channel follows the BCH according to clause 7.1, with the following changes:

- Clause 7.1.1 for PBCH payload generation is replaced by Clause 8.1.1.
- Clause 7.1.2 for scrambling is not performed.
- In clause 7.1.5, the rate matching output sequence length $\mathrm{E}=1386$ when higher layer parameter cyclicPrefix is configured, otherwise, $\mathrm{E}=1782$.

### 8.1.1 PSBCH payload generation

### 8.2 Sidelink shared channel

The processing for SL-SCH transport channel follows the UL-SCH according to clause 6.2, with the following changes:

- Rate matching of SL-SCH follows the rate matching according to clause 6.2 .5 by setting $I_{\text {LBRM }}=0$
- Clause 6.2.7 is replaced by clause 8.2.1

### 8.2.1 Data and control multiplexing

Denote the coded bits for SL-SCH as $g_{0}^{S L-S C H}, g_{1}^{S L-S C H}, g_{2}^{S L-S C H}, g_{3}^{S L-S C H}, \cdots, g_{G^{S L-S C H}-1}^{S L-S C H}$.
Denote the coded bits for the $2^{\text {nd }}$-stage SCI, as $g_{0}^{\text {SCI2 }}, g_{1}^{\text {SCI2 }}, g_{2}^{\text {SCI2 } 2}, g_{3}^{\text {SCI2 }}, \cdots, g_{G^{S C I 2}-1}^{S I 2}$.
Denote the multiplexed data and control coded bit sequence as $g_{0}, g_{1}, \cdots, g_{G-1}$, where $G$ is the total number of coded bits for transmission.

Assuming that $N_{L}$ is the number of layers onto which the SL-SCH transport block is mapped, the multiplexed data and control coded bit sequence $g_{0}, g_{1}, \cdots, g_{G-1}$ is obtained as follows:

Denote $Q_{m}^{S C I 2}$ is modulation order of the $2^{\text {nd }}$-stage SCI.
if $\quad N_{L}=1$,

$$
\text { for } i=0 \text { to } G^{S C I 2}+G^{S L-S C H}-1
$$

if $0 \leq i<G^{S C I 2}$

$$
g_{i}=g_{i}^{S C I 2}
$$

end if
if $\quad G^{S C I 2} \leq i \leq G^{S C I 2}+G^{S L-S C H}-1$

$$
g_{i}=g_{i-G^{\text {cliz }}}^{\text {SL-SCH }}
$$

end if
end for
end if
if $\quad N_{L}=2$,
let $\quad M_{\text {count }, \text { SII } 2}^{\Re}=G^{\text {SCI2 }} / Q_{m}^{\text {SCI2 }}$
set $m_{\text {count }}^{\Re}=0$
for $i=0$ to $M_{\text {count }, S C 12}^{\Re}-1$

$$
\text { for } v=0 \text { to } N_{L}-1
$$

$$
\text { for } q=0 \text { to } Q_{m}^{\text {SCI2 }}-1
$$

$$
\text { if } \quad v=0
$$

$$
g_{m_{\text {ount }}^{n \prime \prime}}=g_{i \cdot Q_{m}^{s c l 2}+q}^{S C I 2}
$$

else

$$
g_{m_{\text {comex }}^{n}}=x \quad / / \text { placeholder bit }
$$

end if

$$
m_{\text {count }}^{\Re}=m_{\text {count }}^{\Re}+1
$$

end for
end for
end for
for $i=0$ to $G^{S L-S C H}-1$

$$
\begin{aligned}
& g_{m_{\text {coum }}^{\Re}}=g_{i}^{\text {SL-SCH }} \\
& m_{\text {count }}^{\Re}=m_{\text {count }}^{\Re}+1
\end{aligned}
$$

end for
end if

### 8.3 Sidelink control information on PSCCH

SCI carried on PSCCH is a $1^{\text {stt }}$-stage SCI, which transports sidelink scheduling information.

### 8.3.1 $\quad 1^{\text {stt-stage }}$ SCI formats

The fields defined in each of the $1^{\text {st }}$-stage SCI formats below are mapped to the information bits $a_{0}$ to $a_{A-1}$ as follows:

Each field is mapped in the order in which it appears in the description, with the first field mapped to the lowest order information bit $\quad a_{0}$ and each successive field mapped to higher order information bits. The most significant bit of each field is mapped to the lowest order information bit for that field, e.g. the most significant bit of the first field is mapped to $a_{0}$.

### 8.3.1.1 SCI format 1-A

SCI format 1-A is used for the scheduling of PSSCH and $2^{\text {nd }}$-stage-SCI on PSSCH
The following information is transmitted by means of the SCI format 1-A:

- Priority - 3 bits as specified in clause 5.4.3.3 of [12, TS 23.287] and clause 5.22.1.3.1 of [8, TS 38.321].
- Frequency resource assignment $-\quad\left\lceil\log _{2}\left(\frac{\mathrm{~N}_{\text {subChannel }}^{\text {SL }}\left(\mathrm{N}_{\text {subChannel }}^{\mathrm{SL}}+1\right)}{2}\right)\right\rceil$ bits when the value of the higher layer parameter sl-MaxNumPerReserve is configured to 2; otherwise
$\left\lceil\log _{2}\left(\frac{\mathrm{~N}_{\text {subChannel }}^{\mathrm{SL}}\left(\mathrm{N}_{\text {subChannel }}^{\mathrm{SL}}+1\right)\left(2 \mathrm{~N}_{\text {subChannel }}^{\mathrm{SL}}+1\right)}{6}\right)\right\rceil \quad$ bits when the value of the higher layer parameter sl-MaxNumPerReserve is configured to 3, as defined in clause 8.1.5 of [6, TS 38.214].
- Time resource assignment - 5 bits when the value of the higher layer parameter sl-MaxNumPerReserve is configured to 2 ; otherwise 9 bits when the value of the higher layer parameter sl-MaxNumPerReserve is configured to 3 , as defined in clause 8.1.5 of [6, TS 38.214].
- Resource reservation period - $\left\lceil\log _{2} N_{r s v_{\text {period }}}\right]$ bits as defined in clause 16.4 of [5, TS 38.213], where $N_{r s v_{\text {period }}}$ is the number of entries in the higher layer parameter sl-ResourceReservePeriodList, if higher layer parameter sl-MultiReserveResource is configured; 0 bit otherwise.
- DMRS pattern - $\left\lceil\log _{2} N_{\text {pattern }}\right\rceil$ bits as defined in clause 8.4.1.1.2 of [4, TS 38.211], where $\quad N_{\text {pattern }}$ is the number of DMRS patterns configured by higher layer parameter sl-PSSCH-DMRS-TimePatternList.
- $\quad 2^{\text {nd }}$-stage SCI format -2 bits as defined in Table 8.3.1.1-1.
- Beta_offset indicator - 2 bits as provided by higher layer parameter sl-BetaOffsets2ndSCI and Table 8.3.1.1-2.
- Number of DMRS port - 1 bit as defined in Table 8.3.1.1-3.
- Modulation and coding scheme - 5 bits as defined in clause 8.1.3 of [6, TS 38.214].
- Additional MCS table indicator - as defined in clause 8.1.3.1 of [6, TS 38.214]: 1 bit if one MCS table is configured by higher layer parameter sl-Additional-MCS-Table; 2 bits if two MCS tables are configured by higher layer parameter sl- Additional-MCS-Table; 0 bit otherwise.
- PSFCH overhead indication - 1 bit as defined clause 8.1.3.2 of [6, TS 38.214] if higher layer parameter sl-PSFCH-Period $=2$ or 4; 0 bit otherwise.
- Reserved - a number of bits as determined by higher layer parameter sl-NumReservedBits, with value set to zero.

Table 8.3.1.1-1: $\mathbf{2}^{\text {nd }}$-stage SCI formats

| Value of 2nd-stage SCI <br> format field | 2nd-stage SCI format |
| :---: | :---: |
| 00 | SCI format 2-A |
| 01 | SCI format 2-B |
| 10 | Reserved |
| 11 | Reserved |

Table 8.3.1.1-2: Mapping of Beta_offset indicator values to indexes in Table 9.3-2 of [5, TS38.213]

| Value of Beta_offset <br> indicator | Beta_offset index in Table 9.3-2 of [5, TS38.213] |
| :---: | :---: |
| 00 | 1st index provided by higher layer parameter sl- |
| BetaOffsets2ndSCl |  |

Table 8.3.1.1-3: Number of DMRS port(s)

| Value of the Number of <br> DMRS port field | Antenna ports |
| :---: | :---: |
| 0 | 1000 |
| 1 | 1000 and 1001 |

### 8.3.2 CRC attachment

CRC attachement is performed according to clause 7.3.2 except that scrambling is not performed.

### 8.3.3 Channel coding

Channel coding is performed according to clause 7.3.3.

### 8.3.4 Rate Matching

Rate matching is performed according to clause 7.3.4.

### 8.4 Sidelink control information on PSSCH

SCI carried on PSSCH is a $2^{\text {nd }}$-stage SCI, which transports sidelink scheduling information.

### 8.4.1 $\quad 2^{\text {nd }}$-stage SCl formats

The fields defined in each of the $2^{\text {nd }}$-stage SCI formats below are mapped to the information bits $a_{0}$ to $a_{A-1}$ as follows:

Each field is mapped in the order in which it appears in the description, with the first field mapped to the lowest order information bit $a_{0}$ and each successive field mapped to higher order information bits. The most significant bit of each field is mapped to the lowest order information bit for that field, e.g. the most significant bit of the first field is mapped to $a_{0}$.

### 8.4.1.1 SCI format 2-A

SCI format 2-A is used for the decoding of PSSCH, with HARQ operation when HARQ-ACK information includes ACK or NACK, when HARQ-ACK information includes only NACK, or when there is no feedback of HARQ-ACK information.

The following information is transmitted by means of the SCI format 2-A:

- HARQ process number - 4 bits as defined in clause 16.4 of [5, TS 38.213].
- New data indicator -1 bit as defined in clause 16.4 of [5, TS 38.213].
- Redundancy version - 2 bits as defined in clause 16.4 of [6, TS 38.214].
- $\quad$ Source ID - 8 bits as defined in clause 8.1 of [6, TS 38.214].
- Destination ID - 16 bits as defined in clause 8.1 of [6, TS 38.214].
- HARQ feedback enabled/disabled indicator - 1 bit as defined in clause 16.3 of [5, TS 38.213].
- Cast type indicator - 2 bits as defined in Table 8.4.1.1-1.
- CSI request - 1 bit as defined in clause 8.2.1 of [6, TS 38.214].

Table 8.4.1.1-1: Cast type indicator

| Value of Cast type <br> indicator | Cast type |
| :---: | :---: |
| 00 | Broadcast |
| 01 | when HARQ-ACK information includes ACK or NACK |
| 10 | Unicast |
| 11 | Groupcast <br> when HARQ-ACK information includes only NACK |

### 8.4.1.2 SCI format 2-B

SCI format 2-B is used for the decoding of PSSCH, with HARQ operation when HARQ-ACK information includes only NACK, or when there is no feedback of HARQ-ACK information.

The following information is transmitted by means of the SCI format 2-B:

- HARQ process number - 4 bits as defined in clause 16.4 of [5, TS 38.213].
- New data indicator -1 bit as defined in clause 16.4 of [5, TS 38.213].
- Redundancy version - 2 bits as defined in clause 16.4 of [6, TS 38.214].
- $\quad$ Source ID - 8 bits as defined in clause 8.1 of [6, TS 38.214].
- Destination ID - 16 bits as defined in clause 8.1 of [6, TS 38.214].
- HARQ feedback enabled/disabled indicator - 1 bit as defined in clause 16.3 of [5, TS 38.213].
- Zone ID - 12 bits as defined in clause 5.8.11 of [9, TS 38.331].
- Communication range requirement - 4 bits determined by higher layer parameter sl-ZoneConfigMCR-Index.

### 8.4.2 CRC attachment

CRC attachment is performed according to clause 7.3.2 except that scrambling is not performed.

### 8.4.3 Channel coding

Channel coding is performed according to clause 7.3.3.

### 8.4.4 Rate Matching

For $2^{\text {nd }}-$ stage SCI transmission on PSSCH with SL-SCH, the number of coded modulation symbols generated for $2^{\text {nd }}-$ stage SCI transmission prior to duplication for the 2nd layer if present, denoted as $Q_{S C I 2}^{\prime}$, is determined as follows:
where

- $O_{\text {SCI2 }}$ is the number of the $2^{\text {nd }}$-stage SCI bits
- $\quad L_{\text {SCI2 }}$ is the number of CRC bits for the $2^{\text {nd }}$-Stage SCI, which is 24 bits.
- $\quad \beta_{\text {offsert }}^{\text {SCI }}$ is indicated in the corresponding $1^{\text {st-stage SCI. }}$
- $\quad M_{s c}^{\text {PSSCH }}(I)$ is the scheduled bandwidth of PSSCH transmission, expressed as a number of subcarriers.
- $\quad M_{s c}^{P S C C H}(l)$ is the number of subcarriers in OFDM symbol $l$ that carry PSCCH and PSCCH DMRS associated with the PSSCH transmission.
- $\quad M_{s c}^{S C I 2}(l)$ is the number of resource elements that can be used for transmission of the $2^{\text {nd }}$-stage SCI in OFDM symbol $l$, for $l=0,1,2 \cdots, N_{\text {symbol }}^{\text {PSCH }}-1$ and for $N_{\text {symbol }}^{\text {PSCH }}=N_{\text {symb }}^{\text {sh }}-N_{\text {symb }}^{\text {PFCH }}$, in PSSCH transmission, where $N_{\text {symb }}^{\text {sh }} N_{\text {symb }}^{\text {slot }}=$ sl-lengthSymbols - 2 , where sl-lengthSymbols is the number of sidelink symbols within the slot provided by higher layers as defined in [6, TS 38.214]. If higher layer parameter sl-PSFCH-Period $=2$ or 4, $\quad N_{\text {symb }}^{\text {PSFH }}=3$ if "PSFCH overhead indication" field of SCI format 1-A indicates " 1 ", and $\quad N_{\text {symb }}^{\text {PSCH }}=0$ otherwise. If higher layer parameter sl-PSFCH-Period $=0, \quad N_{\text {symb }}^{\text {PSFCH }}=0$. If higher layer parameter sl-PSFCH-Period is $1, \quad N_{\text {symb }}^{\text {PSFCH }}=3$.
- $M_{s c}^{S C I 2}(l)=M_{s c}^{\text {PSSCH }}(l)-M_{s c}^{\text {PSCCH }}(l)$
- $\quad \gamma$ is the number of vacant resource elements in the resource block to which the last coded symbol of the $2^{\text {nd }}$ stage SCI belongs.
- $\quad R$ is the coding rate as indicated by "Modulation and coding scheme" field in SCI format 1-A.
- $\alpha$ is configured by higher layer parameter sl-Scaling.

The input bit sequence to rate matching is $d_{0}, d_{1}, d_{2}, d_{3}, \cdots, d_{N-1}$, where $\quad N$ is the number of coded bits.
Rate matching is performed according to Clause 5.4 .1 by setting $I_{B I L}=1$.
The output bit sequence after rate matching is denoted as $g_{0}^{\text {SCI2 }}, g_{1}^{\text {SCI2 }}, g_{2}^{\text {SCI2 }}, g_{3}^{\text {SCI2 }}, \cdots, g_{G^{\text {SCl2 }}-1}^{\text {SCI }}$, where $G^{S C I 2}=Q_{S C I 2}^{\prime} \cdot Q_{m}^{S C I 2}$ and $Q_{m}^{S C I 2} \quad$ is modulation order of the $2^{\text {nd }}$-stage SCI. A UE is not expected to have $G^{S C I 2}>4096$.

### 8.4.5 Multiplexing of coded $2^{\text {nd }}$-stage SCI bits to PSSCH

The coded $2^{\text {nd }}$-stage SCI bits are multiplexed onto PSSCH according to the procedures in Clause 8.2.1.

## Annex A:
